## S1. The table of crystallographic data

Compound	<b>1</b>	<b>2</b>
Formula unit	Ti <sub>12</sub> O <sub>52</sub> N <sub>25</sub> C <sub>130</sub> H <sub>151</sub>	Ti <sub>12</sub> O <sub>57</sub> N <sub>27</sub> C <sub>132</sub> H <sub>135</sub>
CCDC number	2164406	2164407
Moieties	[Ti <sub>12</sub> O <sub>18</sub> (O <sub>2</sub> NC <sub>6</sub> H <sub>4</sub> ) <sub>16</sub> ]·4(NC <sub>4</sub> H <sub>12</sub> )·4(CH <sub>3</sub> CN)·2(HO <sup>t</sup> Pr)	[Ti <sub>12</sub> O <sub>18</sub> (O <sub>2</sub> NC <sub>6</sub> H <sub>4</sub> ) <sub>18</sub> ]·3(H <sub>3</sub> O)·3(NC <sub>4</sub> H <sub>12</sub> )·6(CH <sub>3</sub> CN)
Formula weight (g/mol)	3470.13	3586.03.9
Crystal system	monoclinic	monoclinic
Space group (Nr.)	<i>P2<sub>1</sub>/c</i>	<i>C2/c</i>
a (Å)	17.8911(4)	32.8178(7)
b (Å)	14.9531(4)	15.2483(3)
c (Å)	28.9581(6)	32.1138(8)
α (°)	90	90
β (°)	98.617(2)	114.021(3)
γ (°)	90	90
Volume (Å <sup>3</sup> )	7659.7(6)	14678.5(6)
Z	2	4
Density <sub>calc</sub> (g/cm <sup>3</sup> )	1.505	1.476
Abs. Coeff. μ (mm <sup>-1</sup> )	5.815	6.052
Temperature (K)	173	173
Total reflections	50920	44649
Min-max 2θ (°)	6.174 to 154.34	6.026 to 153.088
Unique reflections	15222	14543
R <sub>1</sub> [I ≥ 2σ]	0.0782	0.1138
wR <sub>2</sub> (all data)	0.2230	0.3215
R <sub>int</sub>	0.0795	0.0792
Goodness of fit on F <sup>2</sup>	1.055	1.102
Parameters	1020	927
Restraints	330	277
Largest diff. peak/hole (e Å <sup>-3</sup> )	1.07/-0.71	1.35/-1.22

S2. Supplementary figures and discussion

**Figure S1.** Powder X-ray diffraction pattern of **1** and **2**, recorded on a Rigaku SmartLab 9KW X-ray diffraction instrument.

**Figure S2.** FTIR spectra of **1** and **2**.

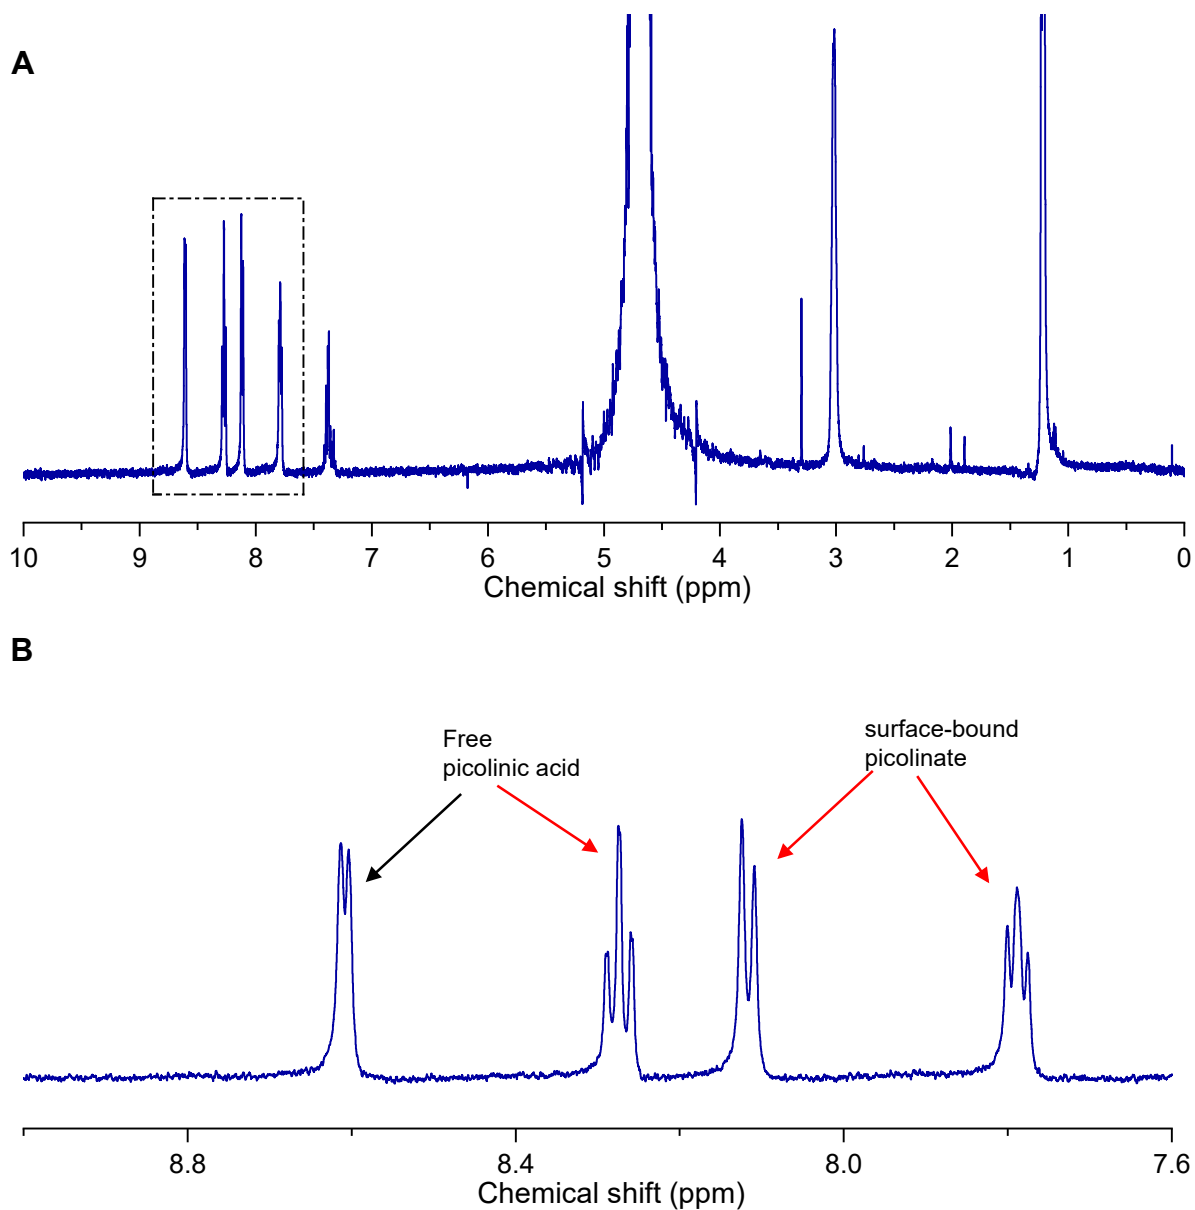

**Figure S3.** Raman spectra of **1** and **2**.

**Figure S4.** The photos of of **1** and **2**.

**Figure S5.** Calculations of direct band gap and indirect band gap values based on UV-vis diffuse reflectance spectra.

**Figure S6.**  $^1\text{H}$  NMR of **1**-Pt solution prepared using  $\text{D}_2\text{O}$ . Panel B is the magnified spectra of panel A. The spectrum implies approximately 50% of PA ligands desorb from the surfaces of **1a** in aqueous solution.

**Figure S7.** The high-resolution ESI-MS spectrum of the 1-Pt solution. The spectrum was obtained using an Agilent Q-TOF 6510 instrument in negative mode.

**Figure S8.** DLS profiles of the various solution samples.

### Estimation of apparent quantum efficiency (AQY)

To calculate the AQY value, we assume that all UV photons reaching the solution were absorbed. Hence, the number of photons,  $N$ , can be calculated using the following equation:

$$N = \frac{\text{photon intensity} \times \text{reaction cross section} \times \text{reaction time}}{hC / \lambda}$$

in which,  $h$  is the Plank constant,  $C$  is the velocity of light and  $\lambda$  is the wavelength, respectively. The UV intensity of the 300 W Xenon lamp was  $3.6 \text{ mW cm}^{-2}$  and the effective irradiated area was ca.  $12 \text{ cm}^2$ . To simplify the calculations, 380 nm was used as the average wavelength of UV.

$$N = \frac{3.6 \times 10^{-3} \times 12 \times 3600}{6.626 \times 10^{-34} \times \frac{3.0 \times 10^8}{380 \times 10^{-9}}} \div (6.022 \times 10^{23}) = 4.9 \times 10^{-4} (\text{mol h}^{-1})$$

The AQY is then calculated using the following equation. The actual reaction of the catalyst is 50 mg, and the yield of  $\text{H}_2$  for **1** and **2** is 9 and  $1.16 \mu\text{mol h}^{-1}$ , respectively.

$$\text{AQY} = \frac{\text{the amount of H}_2 \times 2}{N} \times 100\%$$

The AQY of **1** and **2** for  $\text{H}_2$  evolution are 3.6% and 0.47%, respectively.

**Table S1.** H<sub>2</sub> evolution experiment data of some TOCs.
