In order to select appropriate functional for our calculation, we compare a series of functionals which are widely used in the computational studies relevant to catalytic hydrogenation and dehydrogenation reaction. The rate-determining transition states and intermediates were calculated using different functionals. The results are shown in Table S1. The relative reaction activation energy calculated by different functionals is basically the same trend. Based on these results, we chose M06-L as the functional considering the computational expense and accuracy.

2. The catalytic cycle proposed by Beller et al.

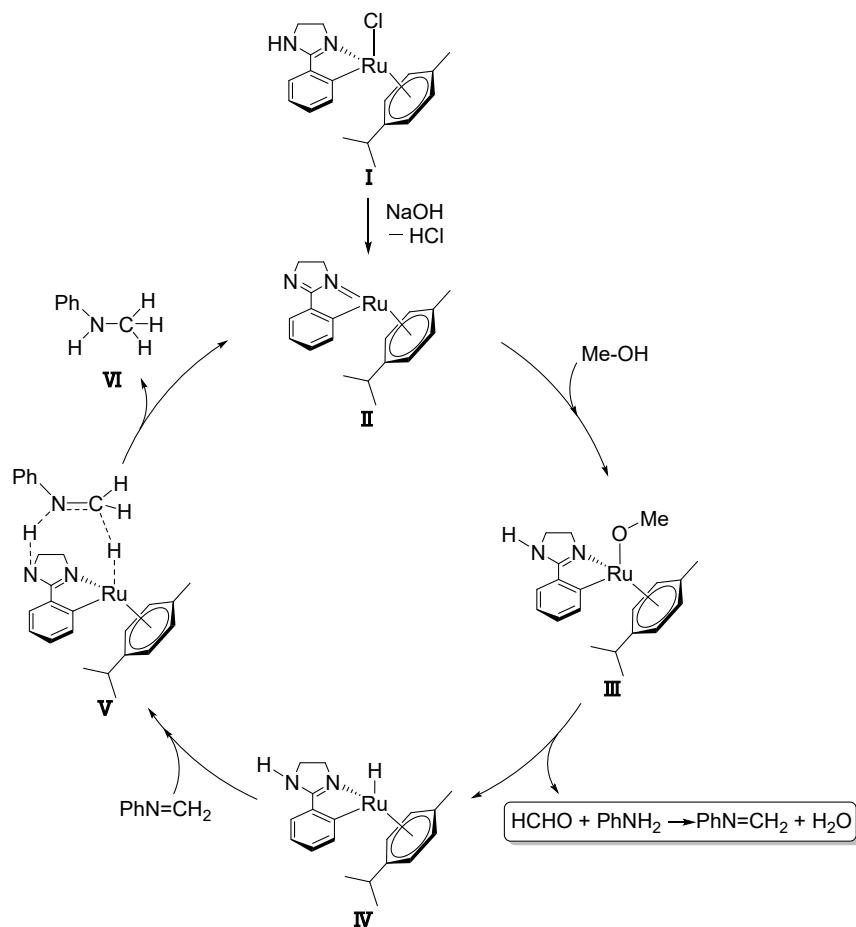

Figure S1. The catalytic cycle proposed by Beller et al.

3. The newly proposed catalytic cycle according to the DFT calculation

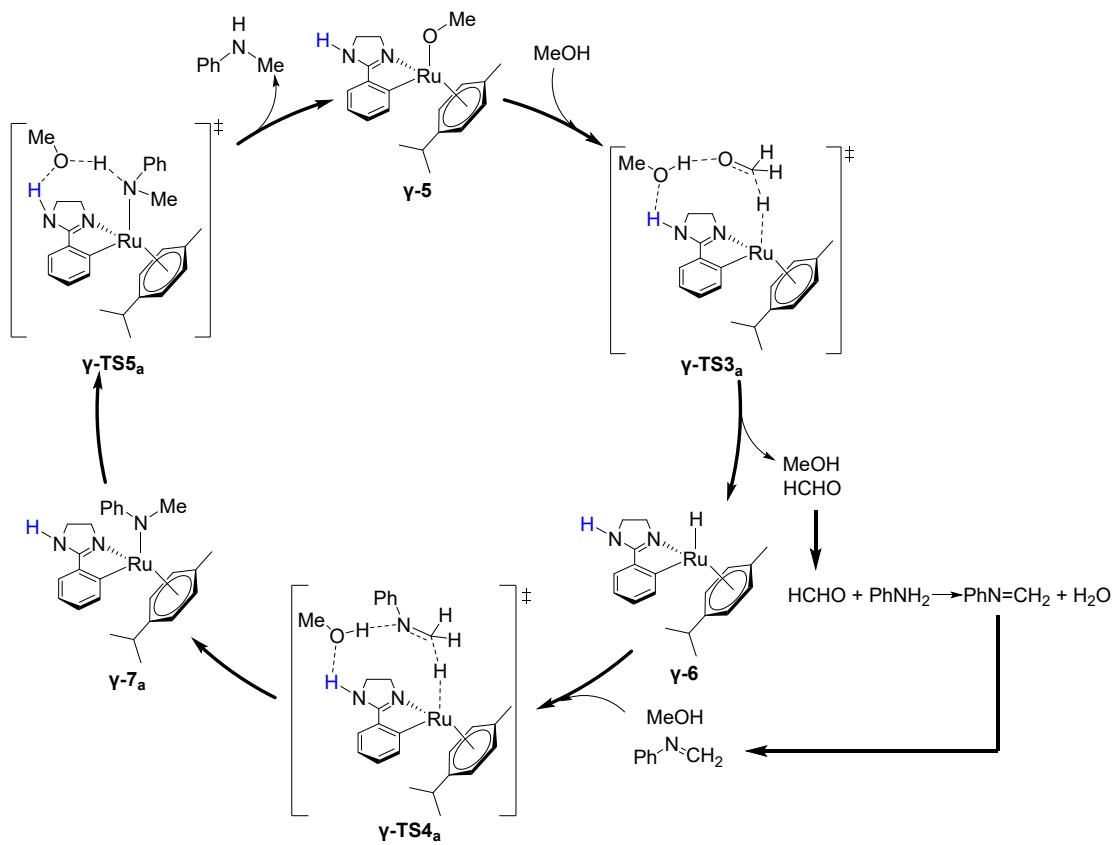

Figure S2. The newly proposed catalytic cycle according to the DFT calculation.

4. The potential energy surface involving the condensation reaction

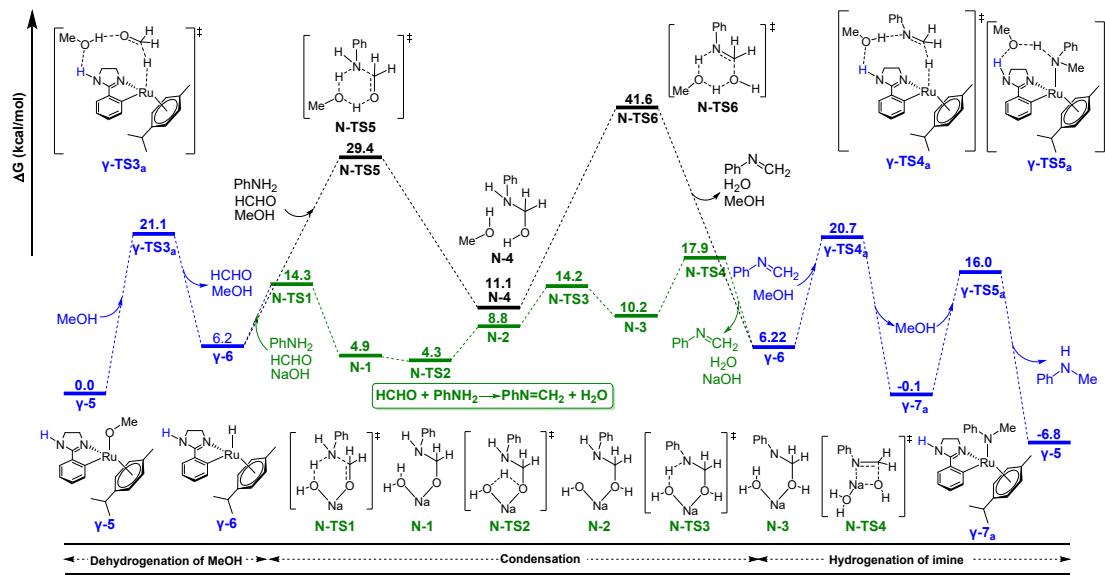

Figure S3. The potential energy surface involving the condensation reaction.

We tried to search for transition states of the condensation reaction. The proton shuttle transition states were successfully located, which possesses a high activation free energy barrier ($\Delta G^\ddagger = 41.6$ kcal/mol) and seems less plausible. Considering the use of NaOH as the base in Beller's system, inspired by the work of Lei et al. (*Asian J. Org. Chem.*, **2021**, 10, 634-641), we perform further calculation including NaOH. The results show that the activation energy barrier for the condensation reaction assisted by NaOH is 13.6 kcal/mol, which does not surpass the activation free energy barrier of hydride transfer and is consistent with the experimental results. Although **N-TS2** is lower compared with **N-1** and **N-2** in solvated free energy, the electronic energy in gas phase **N-TS2** is higher than **N-1** and **N-2** as the transition states were located on the potential electronic surface. Similar results have been obtained in Lei's work..

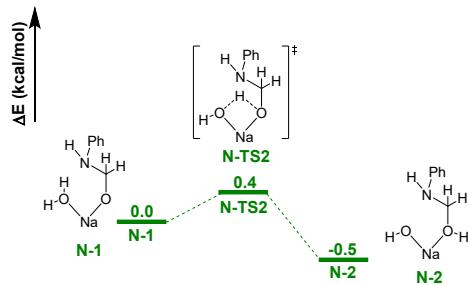

Figure S4. The electronic potential energy surface.

5. The comparison of the condensation reaction using different functionals

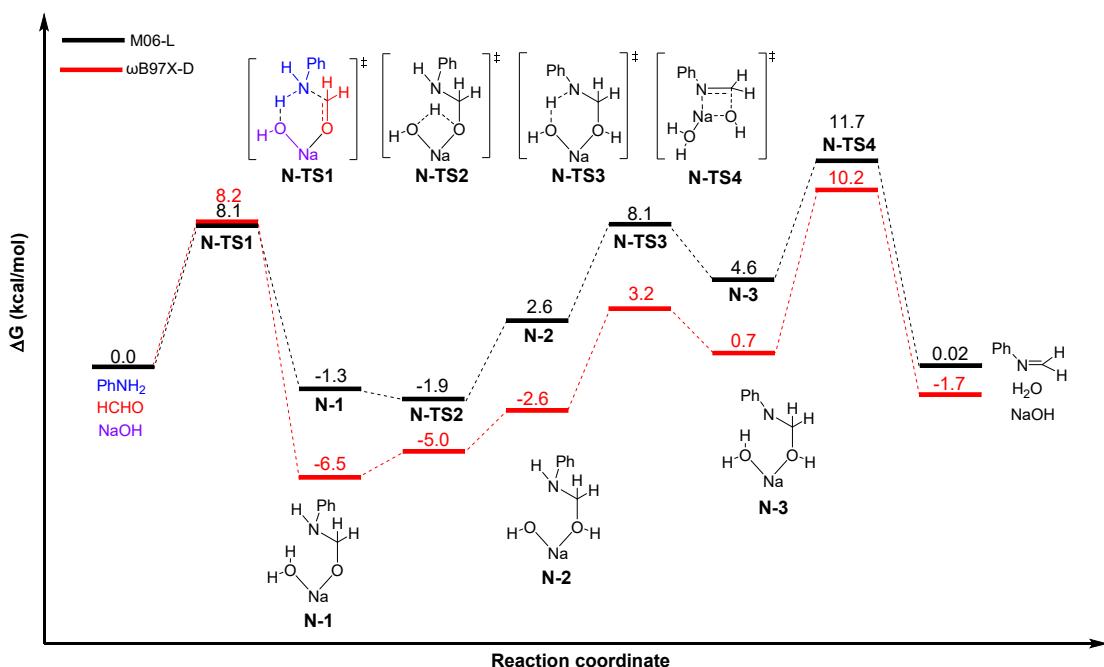

Figure S5. The comparison of the condensation reaction using different functionals.

Given the successful simulation of the condensation reaction process under alkaline conditions using the ω B97X-D functional by Lei et al. (Asian Journal of Organic Chemistry, 2021, 10, 634-641.), we performed a comparative calculation using ω b97x-d functional. The results show that the trends of M06-L and ω B97X-D are basically the same, and the rate-determining steps are both located in the C-O bond cleavage step. With regard to the reliability of M06-L, the effect of CsCO_3 on C-H activation reaction was investigated by Musaev et al using M06-L (*J. Am. Chem. Soc.*, 2014, **136**, 14834-14844) and the mechanistic selectivity of [4 + 1] annulation in the presence or absence of a catalyst was investigated by Lan et al using M06-L (*Chin. Chem. Lett.*, 2022, **33**, 2031-2035.). These works also demonstrate the reliability of M06-L. The main objective of this paper is to compare the energy barrier differences and the mechanistic selectivity of ruthenium catalysts mediated by different ligand sites. Considering that the condensation reaction is not a rate determining step and the efficiency and reliability of M06-L in dealing with transition metal systems, we have continued to use the M06-L calculated data to analyze the

mechanism.

6. The mechanistic preference analysis using energetic span model

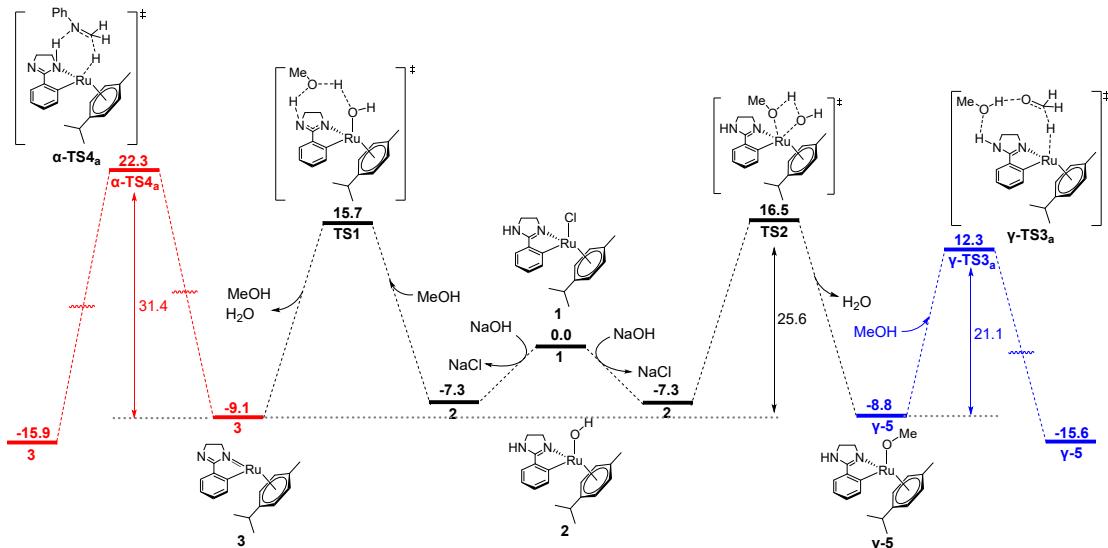

Figure S6. The mechanistic preference analysis using energetic span model.

We used the energetic span model to analyze the calculated potential energy surface. For the calculated data without the entropy correction, the pre-catalyst **1** undergoes the activation process and the **TS1** was found to have lower activation energy barrier. However, the subsequent α -NH pathway way requires to overcome the barrier of 31.4 kcal/mol. Therefore, intermediate **3** returns to **TS2** with the activation energy barrier of 25.6 kcal/mol and give γ -**5**. The rate-determining step of the followed γ -NH pathway requires to overcome 21.1 kcal/mol. Therefore, the generation of γ -**5** is an irreversible process with the activation energy barrier of 25.3 kcal/mol (γ -**5**→**TS2**).

7. The catalytic activity of the catalyst without the γ -NH site

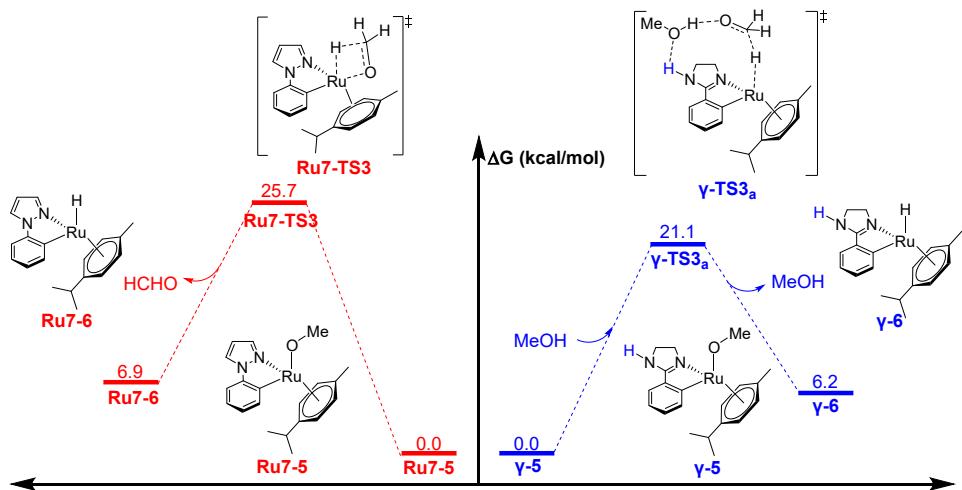

Figure S7. The comparison of the catalytic activity with and without the γ -NH site.

We have selected an example of a catalyst from the Beller's article that showed good activity without the γ -NH site and performed calculations on the absolute speed step of the reaction. The results show that the outer-sphere hydride transfer transition state cannot be located without the assistance of the γ -NH site and MeOH. However, the β -H elimination TS is located with an accessible activation free energy barrier of 25.7 kcal/mol, which can be overcome under reaction conditions at 70 °C. It is worth pointing out that the energy barrier of γ -NH site assisted transition state is only 21.1 kcal/mol, and thus the catalyst with γ -NH site exhibits superior catalytic activity.
