Figure S7. 1-Y(Dy): (a) $\chi_M'' = f(T)$ in zero field (test frequency: 997 Hz, $H_{AC} = 3$ Oe); (b) $\tau = f(H)$ at 5 K.

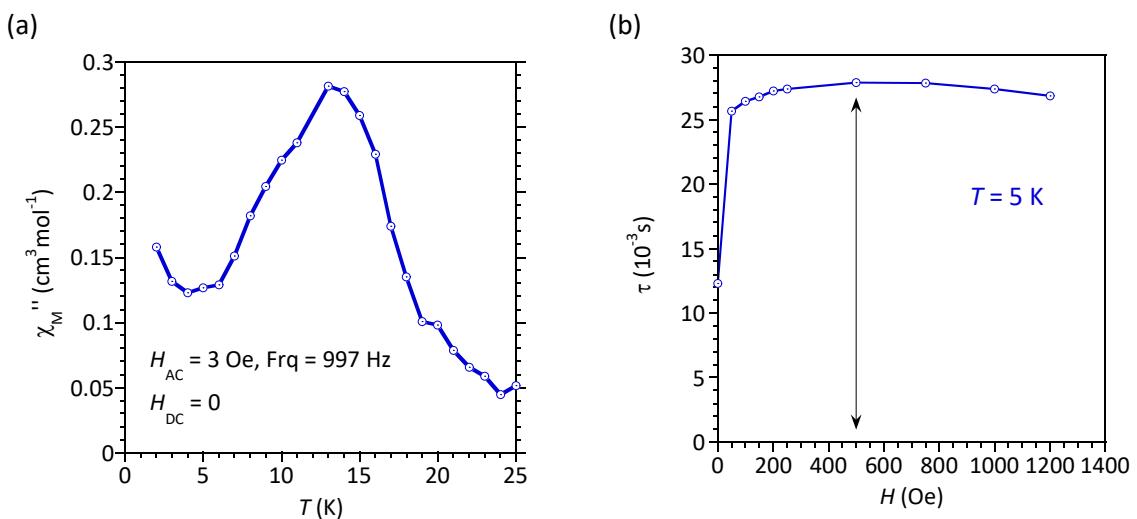

Figure S8. 1-Y(Dy): The temperature and frequency dependencies of χ_M' and χ_M''

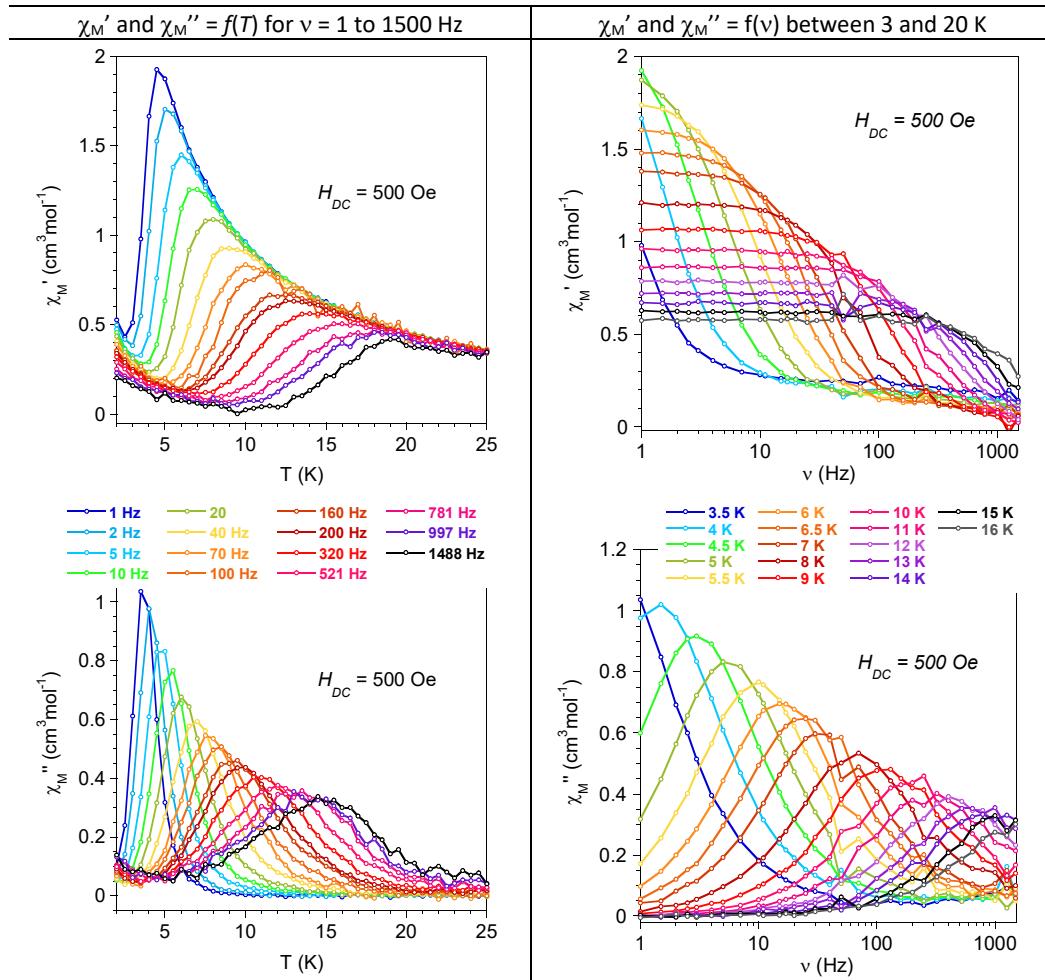

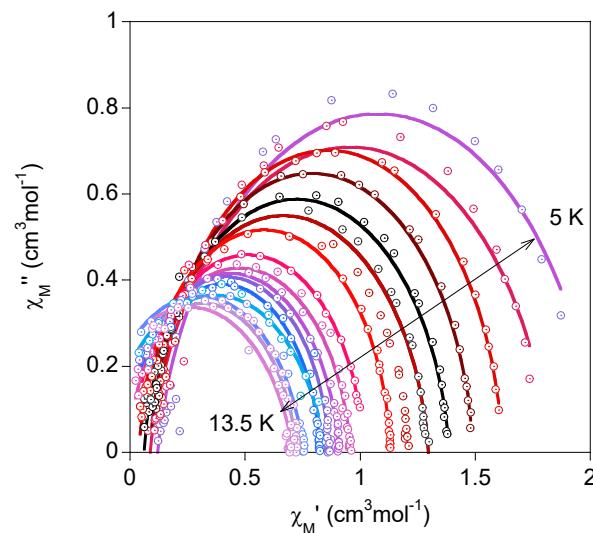

Figure S9. 1-Y(Dy): Cole-Cole plots and best-fit parameters.

The relation time distribution width given by parameter α is small suggesting a single or main relaxation process. This is consistent with the observation made for the bulk complex. It can be noticed that from 12 K and above α become larger which could be related to the noise of the data for larger T due to a weaker signal for χ_M'' .

Table S8. SINGLE_ANISO computed crystal field parameters for **1-Dy**, **2-Dy**, **3-Dy**, **4-Dy**.

$$\hat{H}_{CF} = \sum_{k=-q}^q B_k^q O_k^q$$

The CF parameters were computed using the following equation, and here B_k^q and O_k^q are the crystal field parameters and Steven's operator, respectively.

k	q	B_k^q	B_k^q	B_k^q	B_k^q
