## Supplementary Methods

### Chemicals

Chloroauric acid ( $\text{HAuCl}_4$ ) (99.99%), (3-aminopropyl) trimethoxysilane (APTMS) (97%), sodium citrate (99.0%) and ethylene glycol (>99.0%) were purchased from Alfa-Aesar;  $\text{H}_2\text{SO}_4$  (95%),  $\text{H}_3\text{PO}_4$  (85%), and Acetic acid (99%) were purchased from Sinopharm; silicate solution (27%  $\text{SiO}_2$ ) were purchased from Sigma-Aldrich. potassium hydroxide (99.99%) was purchased from Aladdin.  $\text{KHCO}_3$  ( $\geq 99.99\%$ ),  $\text{KOH}$  (99.99%) were purchased from Aladdin.  $\text{KClO}_4$  (99.9%) and  $\text{D}_2\text{O}$  (for NMR atom % 99.9 D) were purchased from Innochem. Argon (99.999%),  $^{12}\text{CO}_2$  (99.99%),  $^{13}\text{CO}_2$ , and  $^{12}\text{CO}$  (99.9%) was purchased from Linde.  $\text{CO}_2$  saturated  $\text{KHCO}_3$  electrolyte was prepared by purging  $\text{CO}_2$  into  $\text{KOH}$  for 20 min. Milli Q water (18.2  $\text{M}\Omega\cdot\text{cm}$ ) was used throughout the experiment.

**Fig. S1. Electrochemical characterization of Cu(*hkl*) and Cu(poly) electrodes.** CVs of Cu(111) (A), Cu(110) (B) single crystals and Cu(poly) (C) surfaces in 0.1 M KOH saturated with argon,  $\nu = 0.05 \text{ V s}^{-1}$ .

The electrochemical behaviors of Cu(111), Cu(110) and Cu(poly) were tested by CV in 0.1 M KOH solution (Fig. S1). Compared with the literature<sup>1</sup>, it was determined that the properties of the single crystal used in the experiment were relatively intact.

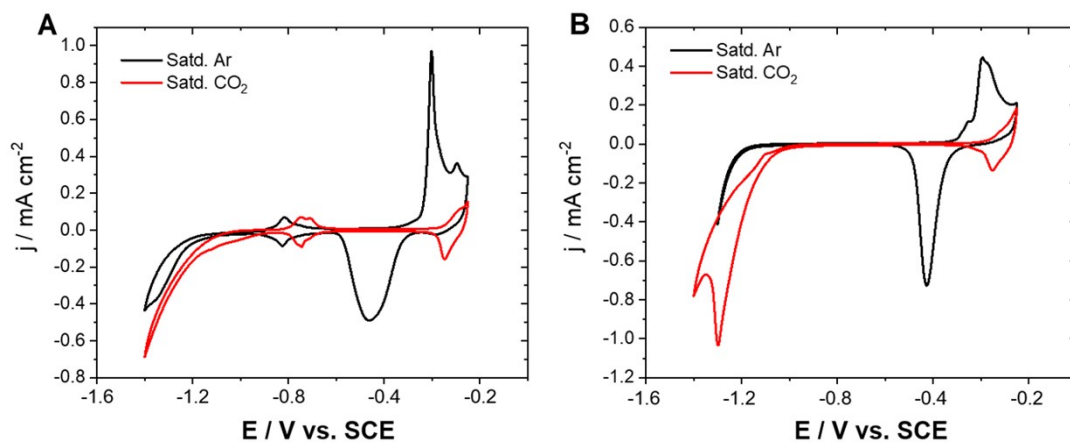

1

2 **Fig. S2. Investigation on the stability of Cu(111) surface structure.** First and second cycles of  
 3 CV of Cu(111) single crystal surfaces in 0.1 M KOH saturated with argon,  $v = 0.05 \text{ V s}^{-1}$ .

4

5 The electrochemical behavior of the first and second cycles of Cu(111) surface in 0.1 M KOH  
 6 solution is consistent, which proves that the performance of Cu(111) can be maintained after the  
 7 redox process.

8

9 **Fig. S3. The control experiment of Cu(*hkl*) in argon and CO<sub>2</sub> atmosphere, respectively.** CVs  
 10 of (A) Cu(111) and (B) Cu(110) in 0.1 M KHCO<sub>3</sub> saturated with Ar (black curve) and saturated  
 11 with CO<sub>2</sub> (red curve),  $v = 0.05 \text{ V s}^{-1}$ .

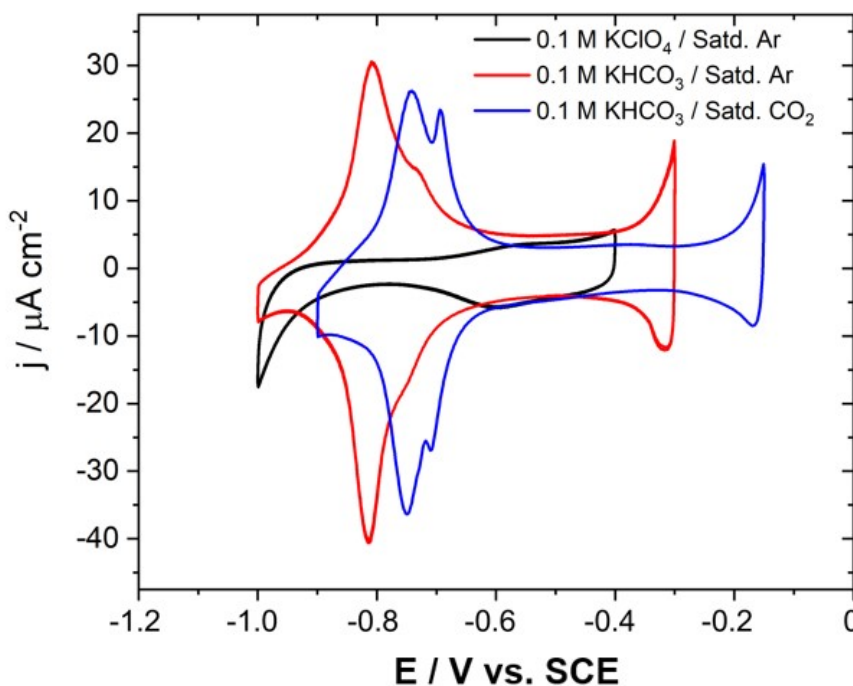

12

13 In **Fig. S3**, we found that the electrochemical peak of Cu-oxygen species on the Cu(*hkl*) surface

1 at -0.4 V was obviously suppressed by the presence of CO<sub>2</sub> in the 0.1 M KHCO<sub>3</sub> solution (sat. Ar),  
 2 indicating that CO<sub>2</sub> was adsorbed on the Cu(*hkl*) surface at this potential.

3

4

5

6 **Fig. S4. CVs of Cu(111) in different solution.** CVs of Cu(111) in 0.1 M KClO<sub>4</sub> saturated with Ar  
 7 (black curve), 0.1 M KHCO<sub>3</sub> saturated with Ar (red curve) and 0.1 M KHCO<sub>3</sub> saturated with CO<sub>2</sub>  
 8 (blue curve),  $\nu = 0.05 \text{ V s}^{-1}$ .

9 Control CVs of Cu(111) were carried out in different solutions as shown in **Fig. S4**, the broad CV  
 10 feature peak around -0.8 V remains the same in Ar sat. 0.1 M KHCO<sub>3</sub>, but this feature was absent  
 11 in Ar sat. 0.1 M KClO<sub>4</sub> solution. These results reveal that the peaks around -0.8 V should arise from  
 12 the HCO<sub>3</sub><sup>-</sup> or CO<sub>2</sub> interaction with the Cu(111) surface.

13

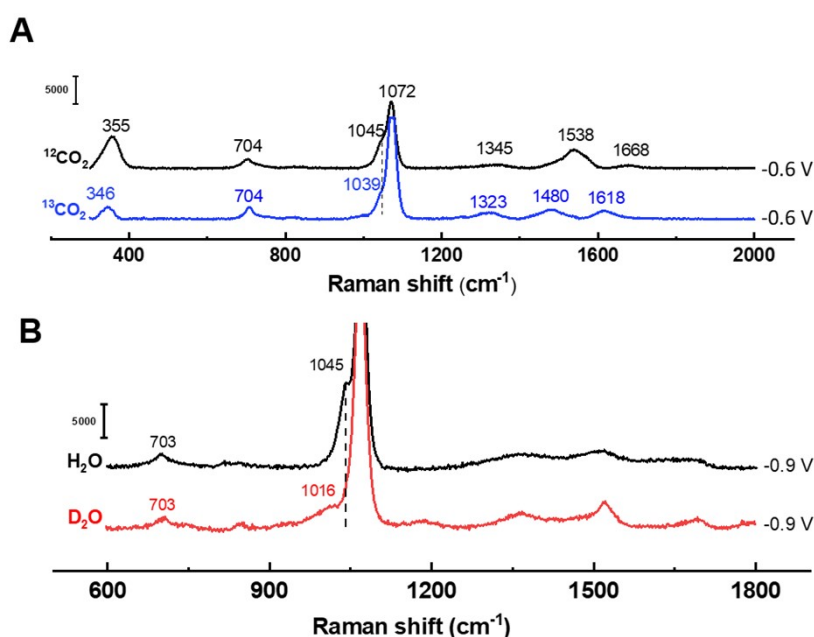

1  
2 **Fig. S5. i-t curves of Cu(111) and Cu(110)** Chronoamperometric curves of Cu(111) and Cu(110)  
3 single crystals at various potentials.

# 1 *In situ* Raman of CO<sub>2</sub>RR on the Cu(hkl) and Spectral peak attribution

2

3 **Fig. S6. The isotope experiments of \*CO<sub>2</sub><sup>-</sup> and \*COOH species.** Comparison of *in situ* SERS  
 4 spectra of CO<sub>2</sub>RR on Cu(poly) at -0.6 V(a) and -0.9 V(b) in 0.5 M KHCO<sub>3</sub>/satd. CO<sub>2</sub> (black curve);  
 5 0.5 M NaH<sup>13</sup>CO<sub>3</sub>/bubbling <sup>13</sup>CO<sub>2</sub> (blue curve); 0.5 M K<sub>2</sub>CO<sub>3</sub>/CO<sub>2</sub>/D<sub>2</sub>O (red curve).

6

7 **Fig. S7. The isotope experiments of \*CO, \*OCCO and \*CH<sub>2</sub>CHO species.** comparison of *in situ*  
 8 SERS spectra of CO<sub>2</sub>RR on Cu(poly) at -1.4 V(A) and -1.8 V(B) in 0.5 M KHCO<sub>3</sub>/sat. CO<sub>2</sub> (black  
 9 curve); 0.5 M NaH<sup>13</sup>CO<sub>3</sub> bubbling <sup>13</sup>CO<sub>2</sub> (blue curve); 0.5 M K<sub>2</sub>CO<sub>3</sub>/CO<sub>2</sub>/D<sub>2</sub>O (red curve).

10

**Fig. S8. The control experiment of  $\text{K}_2\text{CO}_3$  solution.** In situ SERS spectra of Cu(poly) in 0.8 M  $\text{K}_2\text{CO}_3$  solution without  $\text{CO}_2$ .

To investigate the adsorption of  $\text{CO}_3^{2-}$  on the copper electrode surface, we investigated the electrochemical process of the Cu electrode surface in 0.8 M  $\text{K}_2\text{CO}_3$  solution (Fig. S8). Except for the Raman peaks of  $\text{Cu}_2\text{O}$  around  $519\text{ cm}^{-1}$  and  $622\text{ cm}^{-1}$  and the Raman peak of  $\text{CO}_3^{2-}$  at  $1068\text{ cm}^{-1}$  appeared, no other obvious Raman peak around  $1554\text{ cm}^{-1}$  was observed.

**Fig. S9. The low and high wavenumber spectral of  $\text{CO}_2\text{RR}$  on Cu(poly) surface.** In situ SERS of Cu(poly) in 0.5 M  $\text{KHCO}_3$  solution sat.  $\text{CO}_2$ .

1 The in-situ Raman spectral results of CO<sub>2</sub>RR on the Cu(poly) electrode surface show that no obvious  
 2 C-H stretching vibration peak information is observed at high wavenumber (Fig. S9), which  
 3 indicates that the 1045 cm<sup>-1</sup> peak should not be attributed to the HCOO species.

4

5

6 **Fig. S10. The Raman spectra of CH<sub>3</sub>CHO.** Raman spectra of 10% acetaldehyde acid sample.

7

8

9 **Fig. S11. In situ Raman spectra of CO<sub>2</sub>RR reaction on Cu(poly).** *In situ* SERS spectra of  
 10 Cu(poly) in 0.5 M KHCO<sub>3</sub> saturated with CO<sub>2</sub>. pH = 6.8 (vs. SCE).

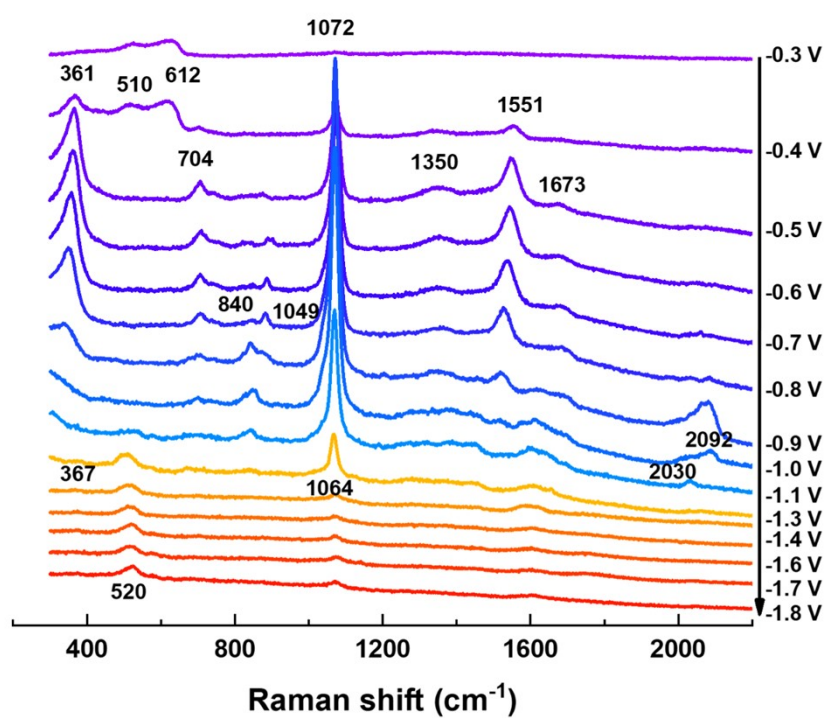

11 In order to accurately identify the attribution of the spectral Raman peaks of the CO<sub>2</sub>RR-related  
 12 intermediate species, and the results on Cu (poly) are similar to those on Cu(110) surface(Fig. S11),  
 13 we conducted a systematic isotope substitution experiment on Cu (poly) surface during the CO<sub>2</sub>RR

1 process. To compare the offset of relative Raman peak in  $^{13}\text{C}$  and  $\text{D}_2\text{O}$  experiments more accurately,  
 2 we have selected different potentials for comparison as shown in Fig. S5-6. We found that the peak  
 3  $\sim 355\text{ cm}^{-1}$  shifts to around  $346\text{ cm}^{-1}$  in  $^{13}\text{C}$  experiment. Thus, this peak should be correlated with  
 4 the “C” atom. The peak  $\sim 1045\text{ cm}^{-1}$  shifts to around  $1039\text{ cm}^{-1}$  and  $1016\text{ cm}^{-1}$  in  $^{13}\text{C}$  and  $\text{D}_2\text{O}$   
 5 experiments, respectively. So Thus, this peak should be correlated with “C” and “H” atoms. The  
 6 peak of  $1345\text{ cm}^{-1}$ ,  $1538\text{ cm}^{-1}$  and  $1668\text{ cm}^{-1}$  shift to lower wavenumber around  $1323\text{ cm}^{-1}$ ,  $1480$   
 7  $\text{cm}^{-1}$  and  $1618\text{ cm}^{-1}$  in  $^{13}\text{CO}_2$ , respectively. The peak of  $2054\text{ cm}^{-1}$  and  $2092\text{ cm}^{-1}$  shift to  $1990\text{ cm}^{-1}$   
 8 and  $2046\text{ cm}^{-1}$  respectively. The peak of  $529\text{ cm}^{-1}$  shift to lower wavenumber in both  $\text{D}_2\text{O}$  and  $^{13}\text{CO}_2$ .  
 9  
 10

11  
 12 **Fig. S12. In situ Raman spectra of  $\text{CO}_2\text{RR}$  process on Cu surface.** In situ Raman spectra of  
 13 Cu(poly) in  $0.5\text{ M KHCO}_3/\text{H}_2\text{O}$  (sat.  $\text{CO}_2$ ) without  $\text{Cu}_2\text{O}$  in the initial potential.  
 14  
 15 After we first reduce the Cu(poly) electrode at very negative potential and then conduct *in situ*  
 16 Raman study of the  $\text{CO}_2\text{RR}$  from  $-0.6\text{ V}$  (Fig. S12), no other characteristic Raman peaks appeared  
 17 except for the Raman peaks of  $\text{HCO}_3^-$  and  $\text{CO}_3^{2-}$  around  $1016\text{ cm}^{-1}$  and  $1072\text{ cm}^{-1}$ , indicating that  
 18 the presence of  $\text{Cu}_2\text{O}$  or Cu oxides in the initial potential range has an important effect for activating

1 CO<sub>2</sub> during the CO<sub>2</sub>RR process.

2

3 **Fig. S13** *In situ* Raman spectra of CO<sub>2</sub>RR reaction on Cu(100). *In situ* SHINERS of Cu(100)

8

9

10 Results of different concentrations of KHCO<sub>3</sub> on Cu(poly) surface. In order to investigate the

1 concentration effect of the  $\text{KHCO}_3$  electrolyte, we have investigated the reaction process of Cu  
 2 (poly) surface under different concentration conditions. As the concentration increases, we found  
 3 that the characteristic Raman peaks of  $\text{CO}_2\text{RR}$ -related intermediate species gradually become  
 4 apparent. (Fig. S15-S20)

5

6

7 **Fig. S21. In situ Raman spectra of Cu(poly) in 0.4 M  $\text{KHCO}_3$  solution  $\text{CO}_2$ -saturated.** In situ  
 8 SERS spectra of Cu(poly) in 0.4 M  $\text{KHCO}_3/\text{H}_2\text{O}$  with  $\text{CO}_2$  gas.

9

10 After introduced  $\text{CO}_2$  gas into the 0.4 M  $\text{KHCO}_3$  solution, we found that the peaks of  $\text{CO}_2\text{RR}$  related  
 11 intermediate species became more obvious, and the characteristic peaks of  $^*\text{OCCO}$  ( $2088\text{ cm}^{-1}$ ) and  
 12  $^*\text{CH}_2\text{CHO}$  ( $525\text{ cm}^{-1}$ ) appeared in low potential range.

1 **Computational results:**

2 In this study, different adsorption structures of CO<sub>2</sub>RR intermediates which adsorbs at Cu(*hkl*)  
3 surface have been calculated as following.

4

5
