## Table of Contents

PFAS Recovery.....	2
Table S1. Sample locations and corresponding ancillary data.....	3
Table S2: The pH of the surface water at time of collection and the sediment % organic carbon content at each sample location.....	4
Table S3. The mobile phase gradient program for quantitative analysis.....	5
Table S4. MS transitions, MRM parameters (CE: collision energy, DP: declustering potential, CXP: cell exit potential, EP: entrance potential), and internal standards for PFAS analysis.....	5
Table S5. Spiked recoveries of each target analyte and the corresponding LOQ and LODs for each compound. The average, standard deviation and percent relative standard deviation is shown below each analyte.....	6
Table S6. The environmental concentrations obtained for precision performance. The average and standard deviations are listed below each set of samples (n=2-3). These averages were used as the reported values.....	7
Table S7: Suspect PFAS screened for in sediment extracts along Cape Fear River.....	8
Figure S1. Chemical structures of each targeted PFAS for quantitative analysis. *Note PFMOPrA and PMPA could not be chromatographically resolved at the time of analysis.....	9

Figure S2: Structures of PFAS screened for in sediment extracts by LC-QTOF. The structures and CAS numbers are based upon previously published information and remain tentative as no authentic standard was available at the time of study.....10

### PFAS Recovery from Sediment

Recoveries were calculated based on a matrix-matched spike extraction from several sediment locations (Table S3). Roughly 10 g of sediment were added to three 50 mL tubes labeled matrix blank (BLK), matrix spike B (SB), and matrix spike A (SA). Before extraction, SB was spiked with a known concentration (0.0231-0.136 ng) of working standards (WS), PFMOAA, PFMOPrA, PFMOBA, HFPO-DA, PFOA and PFOS. After elution, a known concentration of internal surrogates (IS), M-PFBA, M-PFHxA, M-PFOA, M-PFOS and M-HFPO-DA, was added to SB, SA, and BLK. The same amount of WS was also added to SA eluate after elution. Recoveries were determined by subtracting the area ratio of BLK from SB and SA and then calculating the area ratio between SB and SA (see equation 1).

$$\text{Equation 1. } \text{Recovery} = \frac{SB - BLK}{SA - BLK}$$

Where

- SB = response for SPE extract of matrix spiked before SPE
- SA = response for SPE extract of matrix spiked after SPE
- BLK = response for SPE extract of matrix without spike

Table S1. Sample locations and date/time of collections of sediment used in this study.
