## **Text S1. Materials**

Multiwalled carbon nanotubes (MWCNT) with a diameter of 5-15 nm and length of ~10  $\mu\text{m}$  were purchased from Carbon Nano-Materials Technology Co., Ltd., South Korea. Dicyandiamide (99.5%,  $\text{C}_2\text{H}_4\text{N}_4$ ,  $81.08 \text{ g mol}^{-1}$ ) and ethyl alcohol (99.5%,  $\text{C}_2\text{H}_5\text{OH}$ ), were purchased from Sigma Aldrich, South Korea. Potassium persulfate (PS,  $\text{K}_2\text{S}_2\text{O}_8$ ,  $270.32 \text{ g mol}^{-1}$ ), sodium hydroxide ( $\text{NaOH}$ ,  $40 \text{ g mol}^{-1}$ ), sodium chloride ( $\text{NaCl}$ ,  $58.44 \text{ g mol}^{-1}$ ), sodium sulfate ( $\text{Na}_2\text{SO}_4$   $142.04 \text{ g mol}^{-1}$ ), sodium nitrate ( $\text{NaNO}_3$   $84.99 \text{ g mol}^{-1}$ ), sodium carbonate ( $\text{Na}_2\text{CO}_3$ ,  $105.99 \text{ g mol}^{-1}$ ), and sodium bicarbonate ( $\text{NaHCO}_3$ ,  $84.01 \text{ g mol}^{-1}$ ) were received from SamChun Chemicals, South Korea. All chemicals were laboratory grade and were used without further purifications. In addition, HPLC grade methanol (99%,  $\text{CH}_3\text{OH}$ ,  $32.04 \text{ g mol}^{-1}$ ) for HPLC was purchased from Honeywell, South Korea.

## **Text S2. Characterizations**

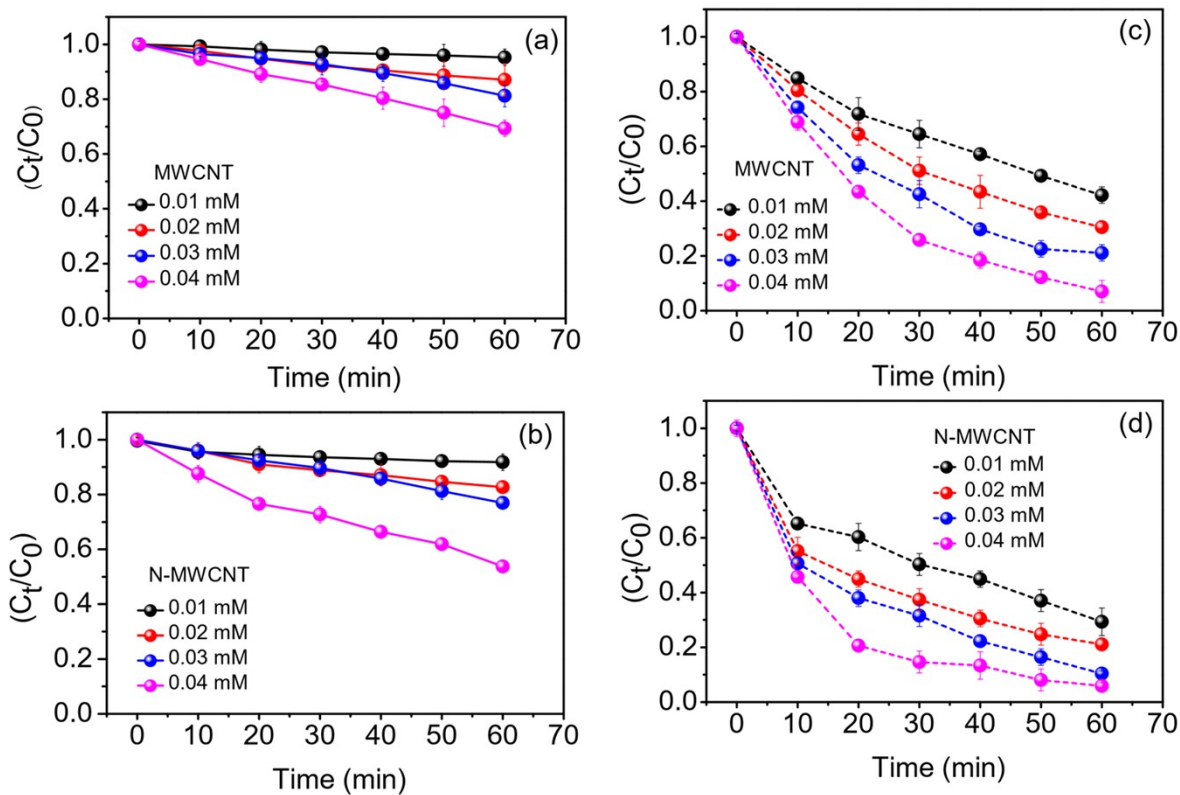

The crystalline nature and structural deformation of the as-synthesized N-MWCNT were gathered using high resolution Raman spectroscopy (InVia Raman microscopes) and a powder X-ray diffractometer (XRD, D8 Advance Bruker) analysis. From the XRD results, the interlayer distance of the graphitic plane was determined by Bragg's equation,  $n\lambda = 2d\sin\theta$ , where  $\lambda$  is the incident wavelength ( $1.5406 \text{ \AA}$ ),  $\theta$  is the peak position,  $n$  is the order of diffraction (1), and  $d$  is the interlayer spacing or d-spacing value. The chemical entity, its composition, and the structural defects density of the carbocatalyst were analyzed with a K-Alpha TM X-ray photoelectron spectrometer (XPS) system (ThermoFisher Scientific, USA) and all the XPS spectra were fitted by XPSSEAK 41 software. The surface topography was analyzed with high resolution transmission electron microscopy (HR-TEM, JEOL JEM-2100F). The point of zero charge ( $\text{pH}_{\text{PZC}}$ ) of the carbon catalyst were measured using a zeta potential analyzer (ZetaPlus, Brookhaven, USA)
