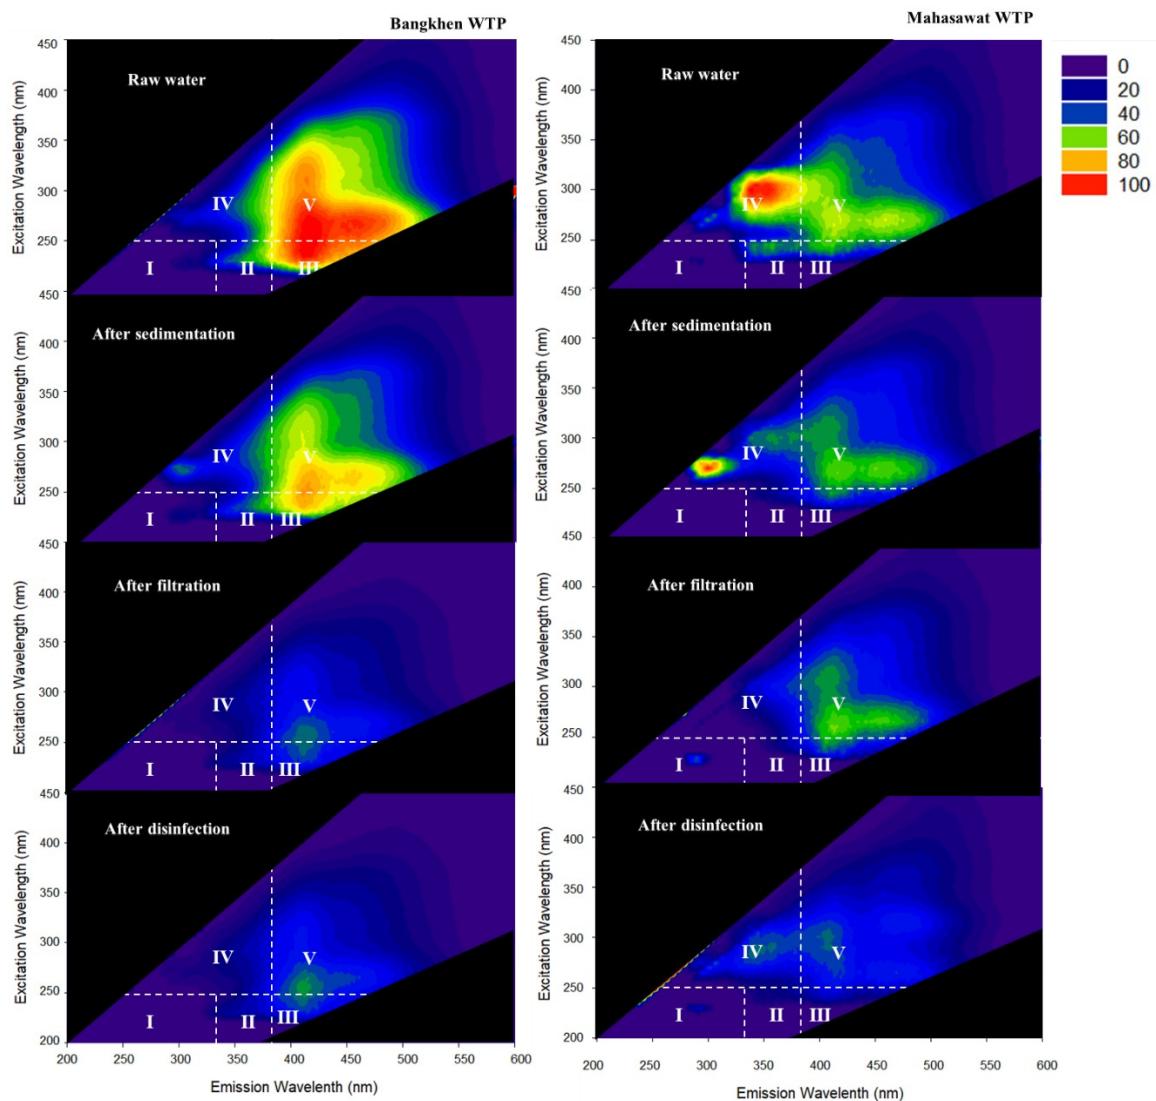

Figure S1 Excitation and emission spectra of BK-WTP and MH-WTP

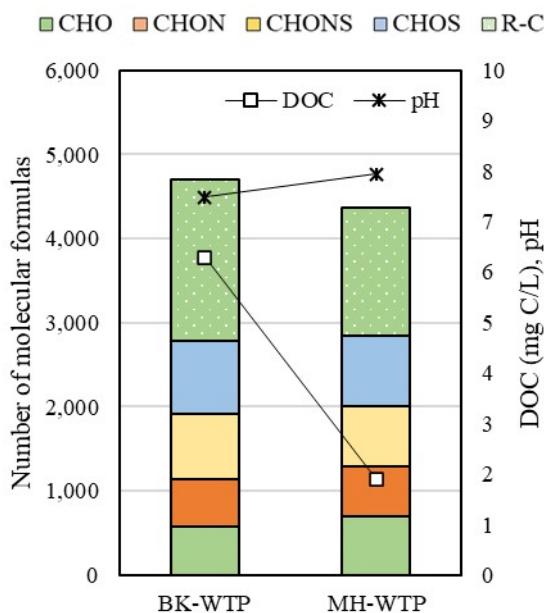

Figure S2 Number of molecular formulas of DOM in raw water samples of BK-WTP and MH-WTP

DOM components in raw water samples of BK-WTP and MH-WTP were classified according to heteroatoms assigned in the molecular formulas. The classification includes molecular formulas contain carbon, hydrogen and oxygen (CHO), CHO and nitrogen and sulfur heteroatoms (CHON, CHOS and CHONS) and molecular formulas containing chlorine (R-Cl). In total, 4701 and 4362 molecular formulas satisfied the assignment criteria for BK-WTP and MH-WTP (Figure S2), respectively. Collectively, the total absolute intensity of the molecular formulas accounted for 7.66×10^{10} and 3.27×10^{10} for BK-WTP and MH-WTP, respectively. This was quite consistent with DOC concentrations in the samples (6.3 mg/L for BK-WTP and 1.9 mg/L for MH-WTP).

DOM in RW of Both WTPs had similar portions of CHO, CHON, CHOS, CHONS and R-Cl. For BK-WTP, the portions were 12.3%, 12.0%, 18.5%, 16.4%, and 40.8% for CHO, CHON, CHOS, CHONS, and R-Cl, respectively. For MH-WTP, the portions were 16.0%, 13.5%, 19.1%, 16.5% and 34.9% for CHO, CHON, CHOS, CHONS and R-Cl, respectively. The largest portion of both WTPs was R-Cl and CHOS components. The presence of R-Cl in our samples were not surprising since the raw water samples were from the rivers which retrieve tremendously diverse DOM sources (wastewater effluent and agricultural runoff) along the lengths of the rivers. Moreover, R-Cl can naturally be produced from biological processes number of organisms ranging from bacteria, algae, lichens, plants and insects^{1, 2}.
