

Supplementary Methods

The cross-reactivity assays of MTM and ATM

The dot blot was performed to analyze the cross-reactivity of MTM and ATM to bind with IgE by the method of Han *et al.*¹

Figure legends.

Figure S1. Prediction of the linear mimotopes of ATM using bioinformatics tools.

(A) Prediction of linear mimotopes in ATM using the DNA Star Protean system.

(B) Prediction of linear mimotopes in ATM using BepiPred.

Figure S2. IgG-binding capacity analysis of denaturant-treated ATM.

(A) Dot blot analysis of denaturant-treated ATM using using ATM polyclonal antibody. BSA was used as the negative control; ATM was used as the positive control.

(B) IgG-immunoblot assays of denaturant-treated ATM using the software Image J. The x-coordinate represented the intensity of IgG-binding capacity of ATM being treated with denaturants at different concentrations.

Figure S3. IgE-binding capacity analysis of the cross-reactive sera between MTM and ATM.
