1. **General information**

NMR spectra were recorded on a Brucker Avance 600 MHz spectrometer employing the residual signal of the deuterated solvent as internal standard. Chemical shifts ($\delta$) are expressed in ppm and coupling constants ($J$) in Hertz (Hz). Merck Silica gel 60 F254 (aluminum foil) plates were used for TLC analysis (Sigma Aldrich, Milan, Italy); flash column chromatography was performed on Merck Silica gel (230–400 mesh) (Sigma Aldrich, Milan, Italy). Detection of TLC analyses has been performed under UV light at 254 and 365 nm. Organic solutions were concentrated using a Buchi rotary evaporator below 40 °C at 25 torr. Spectrophotometric assays were performed using a spectrophotometer bought from Eppendorf, Milan, Italy. MS spectra were recorded using electrospray ionization (ESI) technique on a Waters Micromass Q-Tof micro mass spectrometer.

2. **Chemicals**

Cell growing and strain maintaining media as well as commercially available reagents and solvents were purchased from Thermo Fischer Scientific or Merck (Sigma Aldrich, Milan, Italy).

3. **Cloning, Overexpression and Purification of MsAcT**

Protein expression and purification were performed following previously reported protocols by Contente et al.$^1$ Figure S1 shows the crude extract, pellet and pure protein analyzed by SDS-PAGE. The monomer of MsAcT is 25.6 kDa. Typically, starting from 2 g of wet cell paste, it was possible to obtain 130 mg of pure protein (9 mg/mL).

4. Activity assay of MsAcT enzyme

Enzyme activity measurements were performed following previously reported protocols by Contente et al. employing p-nitrophenylacetate as substrate. The specific activity (U/mg) was expressed as μmol of product generated per minute per milligram of enzyme. MsAcT final specific activity: 120 U/mg.

5. Optimization of the reaction conditions

Batch reactions using MsAcT were performed in 10 mL screw cap tubes; 1 mL reaction mixture in 0.1 M phosphate buffer pH 8.0 containing different concentrations (0.1-1 M) of aniline (1a), 10% v/v DMSO, 1 mg/mL enzyme, and fixed amount of succinic anhydride 2a (1 eq.) were left under magnetic stirring at 25 °C (Table S1).

6. Batch reactions

Batch reactions were performed in 10 mL screw cap tubes; 2 mL reaction mixture in 0.1 M phosphate buffer, pH 8.0 containing 1 M amine, 1 eq. anhydride, 10% v/v DMSO, 1 mg/mL enzyme was left under magnetic stirring at 25 °C. Samples withdrawn at different reaction times (30 min, 1 h, 2 h, 5 h, 24 h, 48 h) were monitored by TLC (cyclohexane/EtOAc 7:3 + 0.1% CH$_3$COOH or 0.1% TEA). In the reaction mixture EtOAc was added and the organic phase was washed with 1 N HCl and subsequently with brine. The organic phase was dried over Na$_2$SO$_4$, filtered and evaporated under reduced pressure. The crude product was purified by flash chromatography (cyclohexane/EtOAc 7:3 → 1:1) giving the desired products.
