Cartesian coordinates, total electronic energies and thermal corrections for various stationary points identified through (SMD)/M06–2X/6–31+G(d) calculations.	S13–S63
Cartesian coordinates and total Gibbs Free energies for various stationary points identified through QM/MM ONIOM calculations at the M06–2X/6–31+G(d):AMBER level of theory.	S64–S103

**Figure S1** Calculated UV-Vis absorption spectra for A) NAD<sup>+</sup> and B) NADH coenzymes in the aqueous solution (in black) using the TD-DFT approach and the (SMD)/M06-2X/6-31+G(d) level of theory. Each display also contains the corresponding UV-Vis spectra for their constituting fragments that are liberated following the cleavage of the matching N-C(ribose) bond during degradation, as discussed in the text. Both graphs show that the adenine unit is responsible for the experimentally observed transition at 260 nm, while the reduced neutral form of the nicotinamide moiety is responsible for the absorption at 340 nm, thereby only visible in the UV-Vis spectra of NADH. Upon its oxidation to the cationic form present in NAD<sup>+</sup>, the absorption at 340 nm is diminished and not visible when the UV-Vis spectrum of the former coenzyme is recorded.

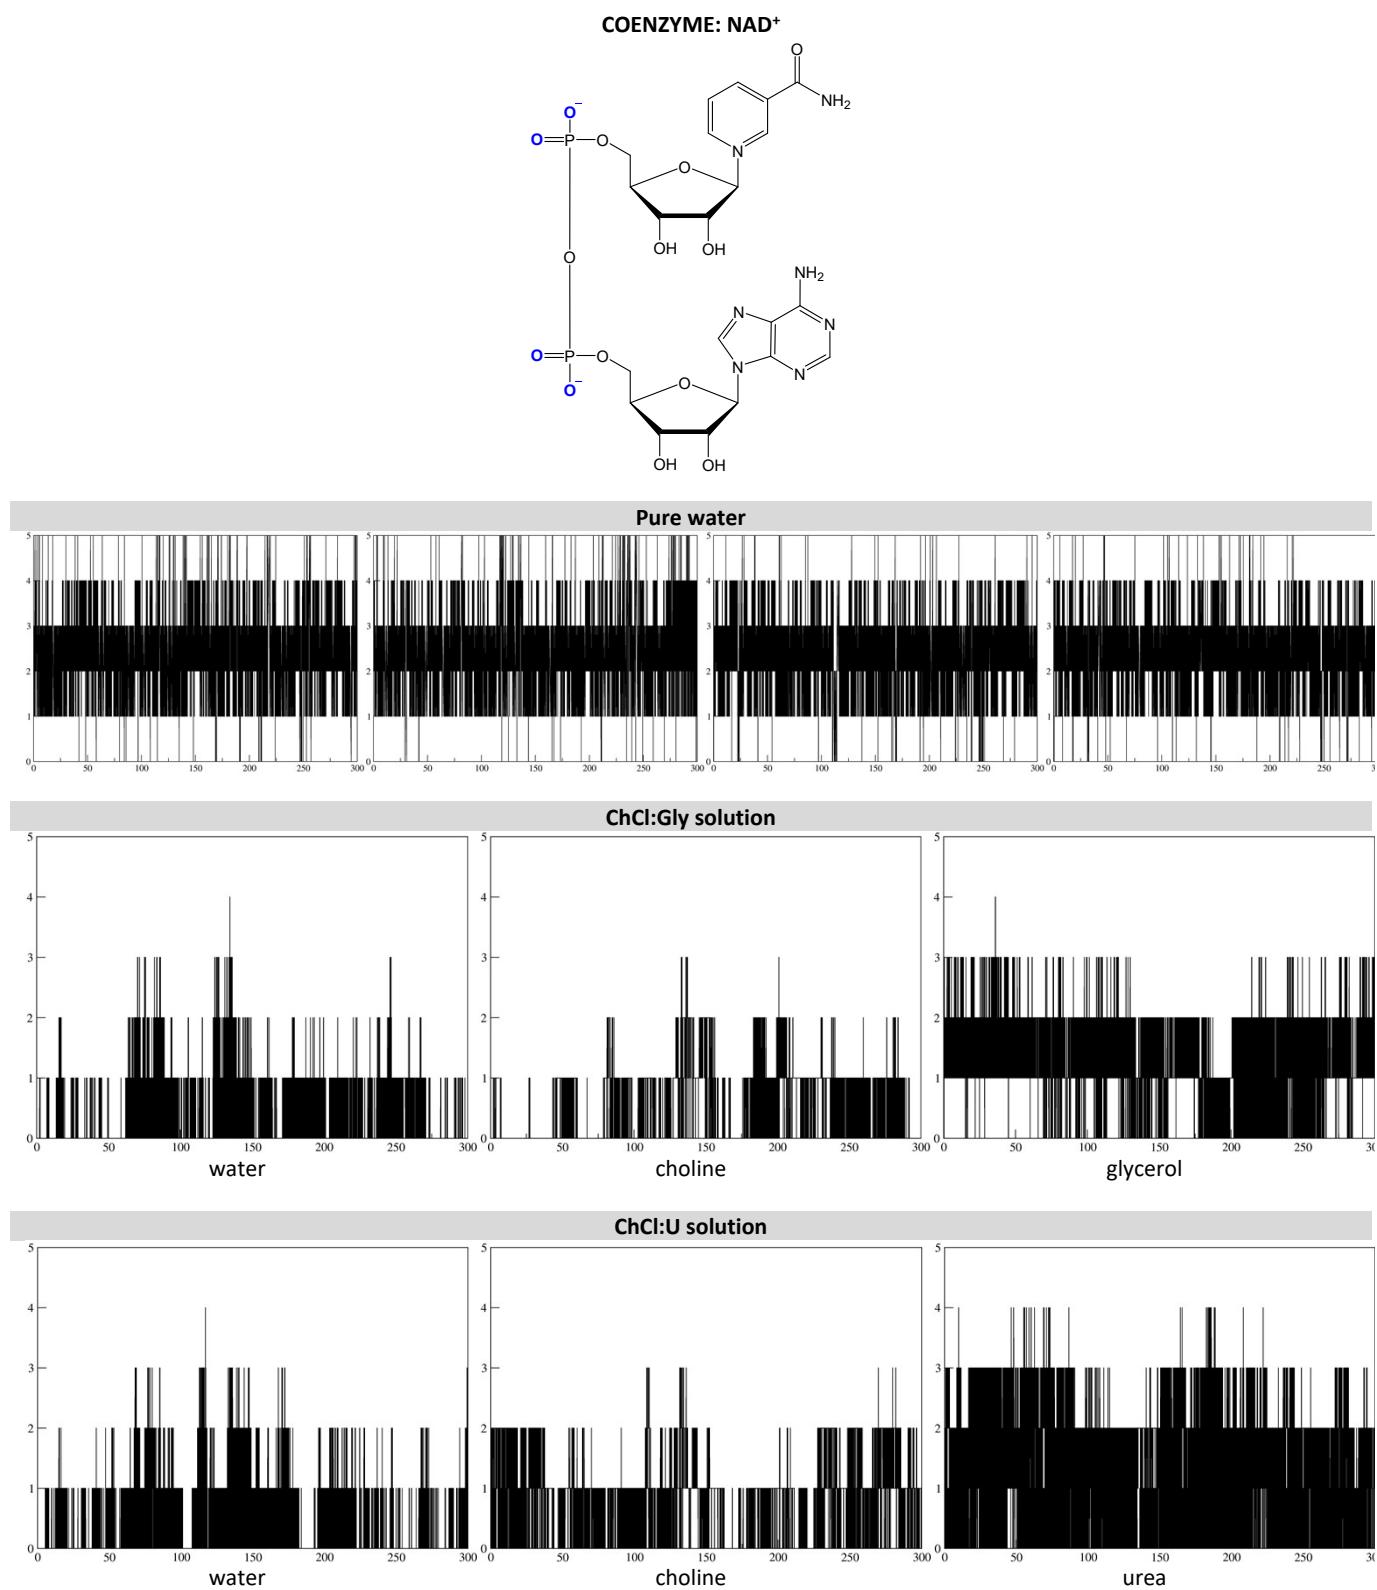

**Figure S2** Evolution of distances between centers of mass among pyridine and adenine aromatic rings in A) NAD<sup>+</sup> and B) NADH during 300 ns of MD simulations. The inspected distances were found below 5 Å during 66% and 62% of the simulation times, thereby indicating the predominance of the hydrophobic π···π stacking interactions.

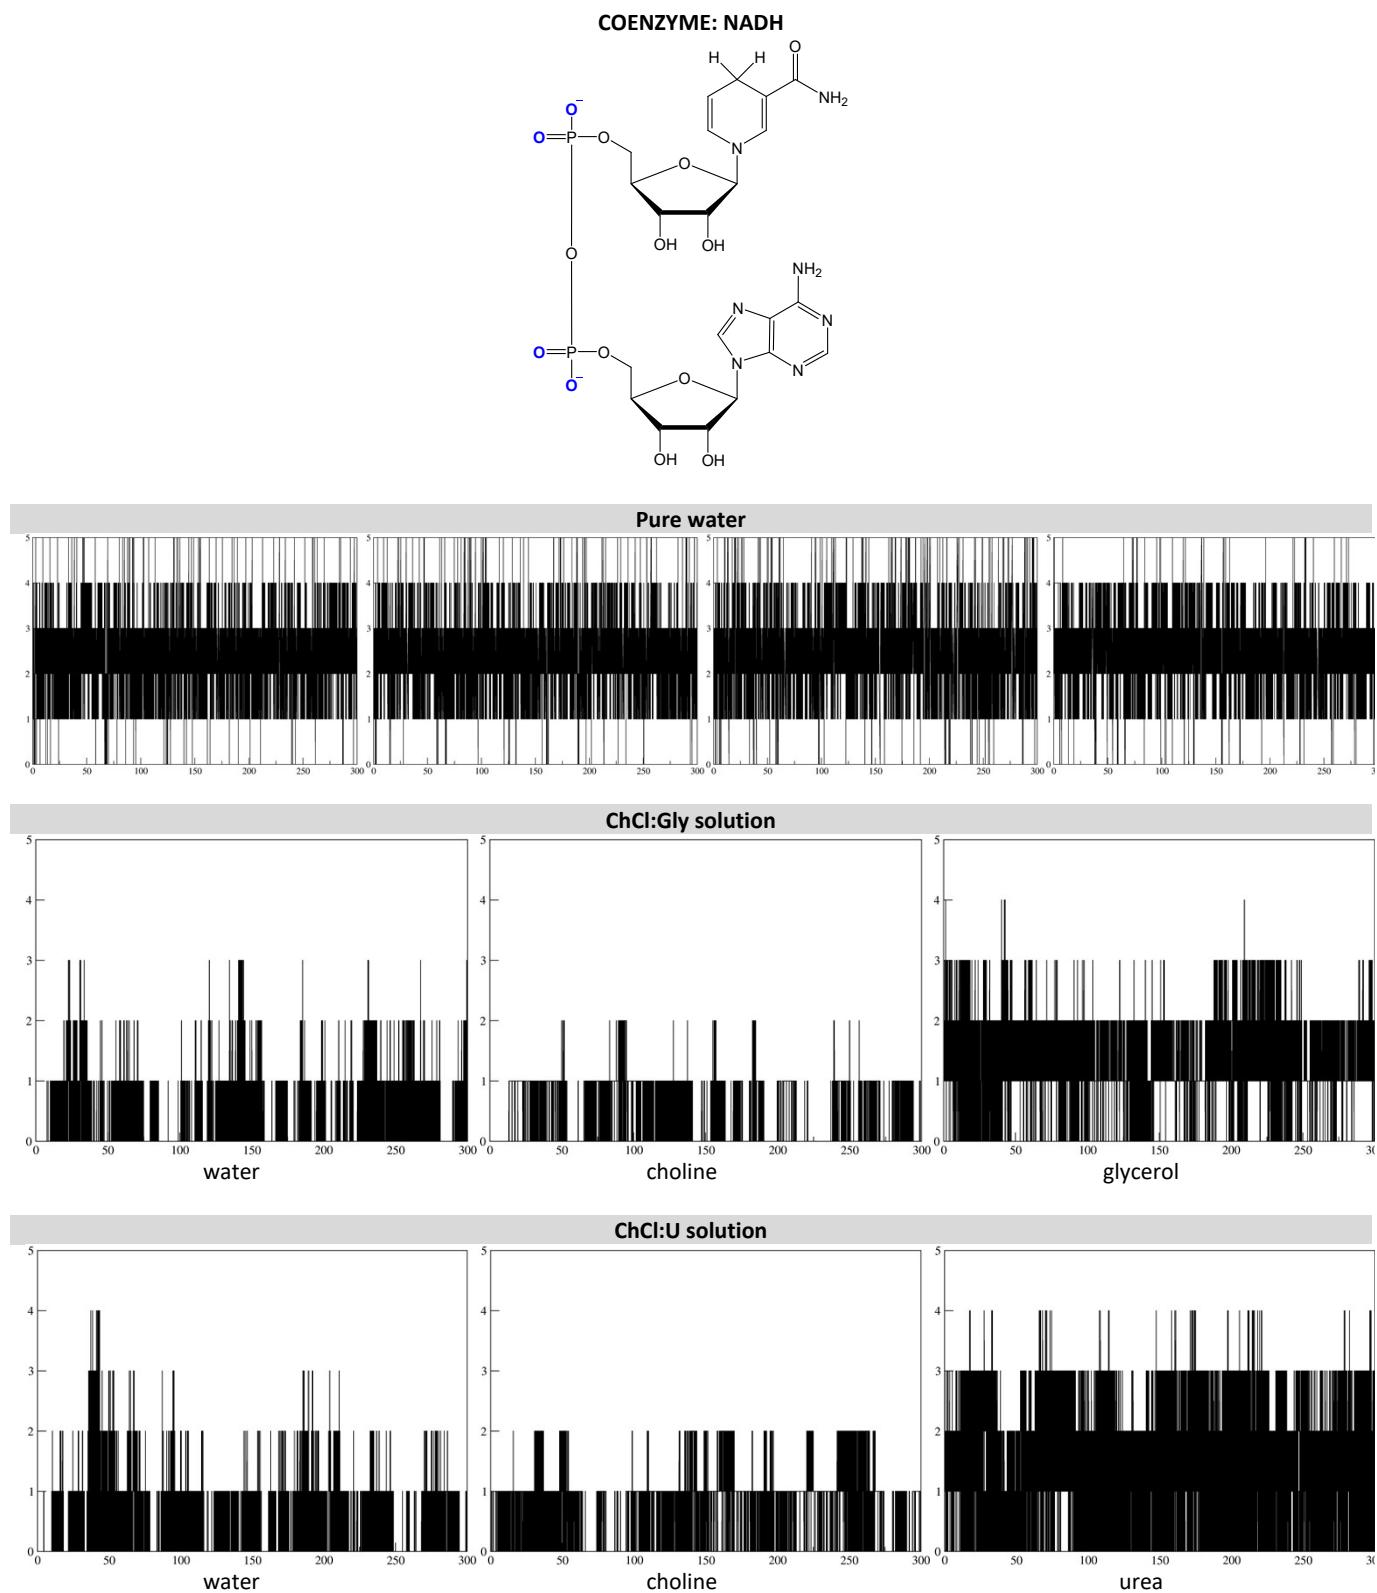

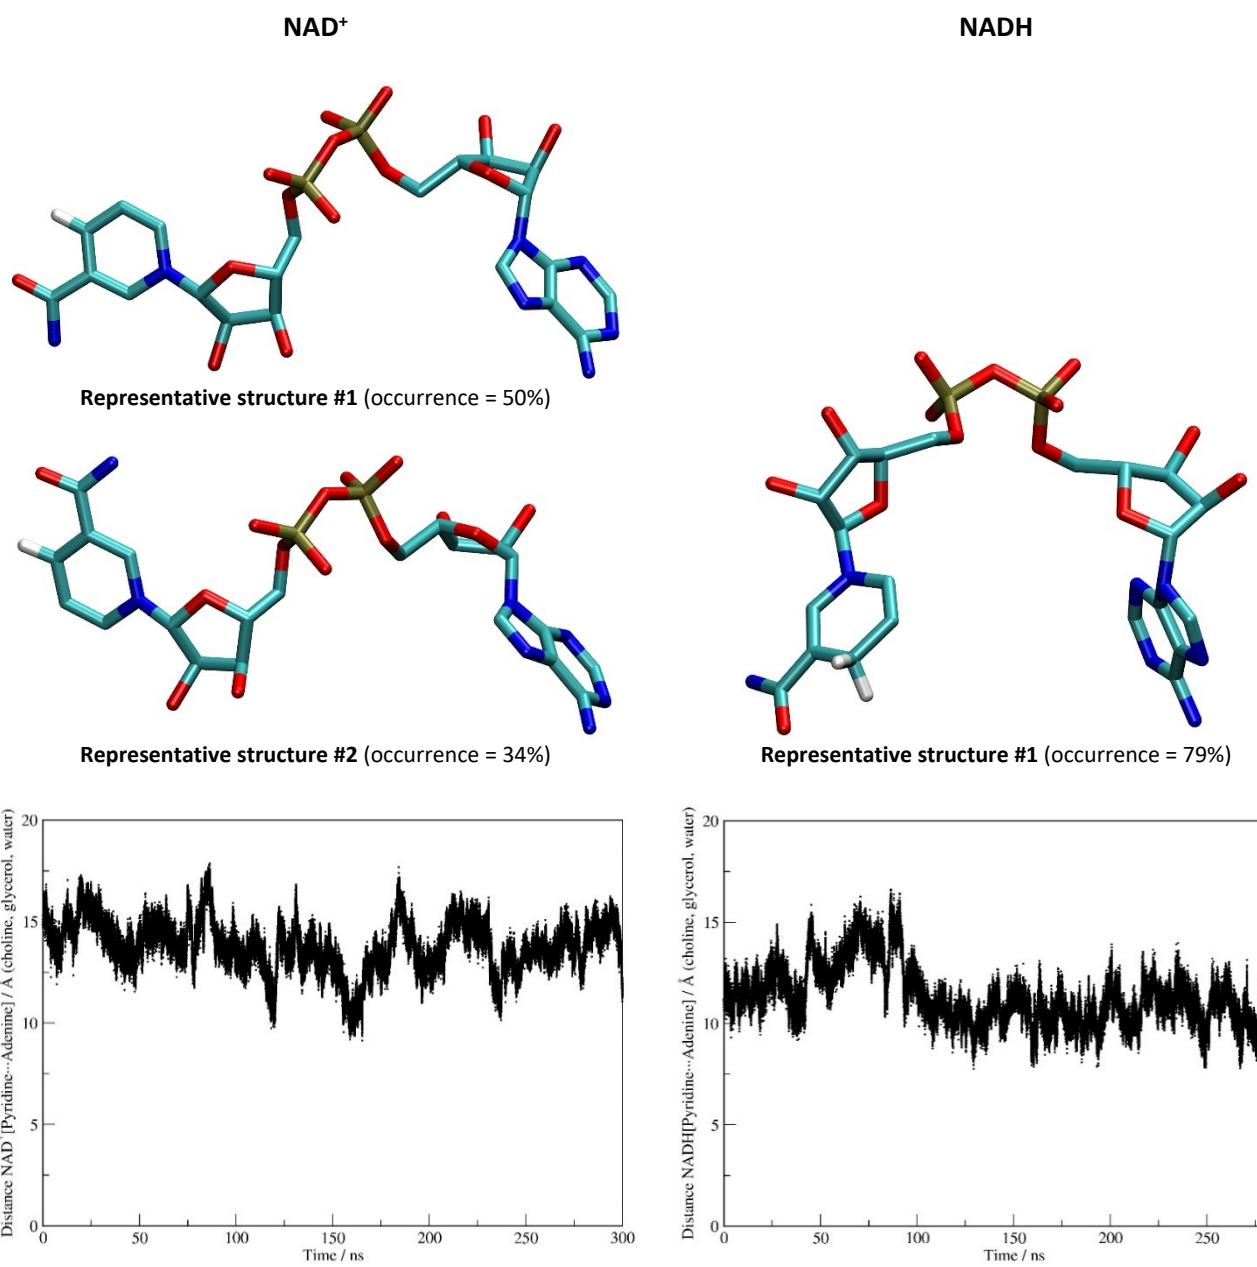

**Figure S3** Representative structures of A) NAD<sup>+</sup> and B) NADH with the first solvation sphere of water molecules in pure aqueous solution, as obtained through MD simulations.

**Table S1** The number of solvent molecules in the first solvation shell of the NAD<sup>+</sup> phosphodiester group located within 3 Å during 300 ns of MD simulations. For pure water, each display pertains to one of the phosphate O-atoms colored in blue, while for both DES solutions, each display combines all phosphate O-atoms in a single picture corresponding to a particular solvent component. In pure water, typically three water molecules optimally solvate each phosphate oxygen, while, in both DES solutions, the number of water molecules is smaller and the phosphate solvation is overtaken by other components.

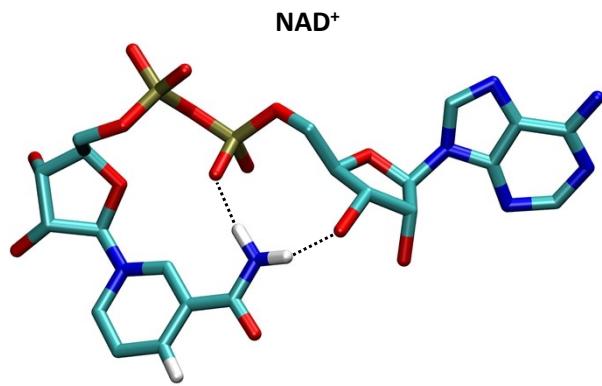

**Table S2** The number of solvent molecules in the first solvation shell of the NADH phosphodiester group located within 3 Å during 300 ns of MD simulations. For pure water, each display pertains to one of the phosphate O-atoms colored in blue, while for both DES solutions, each display combines all phosphate O-atoms in a single picture corresponding to a particular solvent component. In pure water, typically three water molecules optimally solvate each phosphate oxygen, while, in both DES solutions, the number of water molecules is smaller and the phosphate solvation is overtaken by other components.

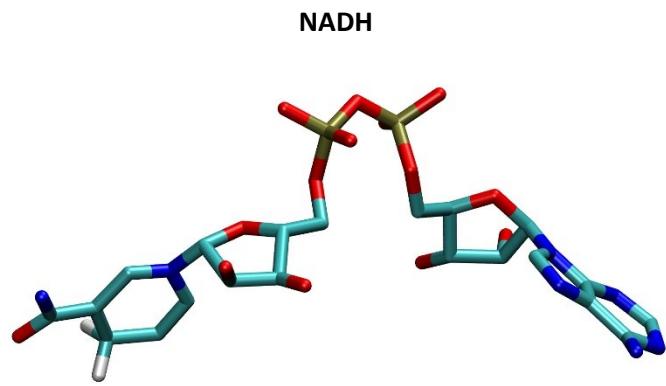

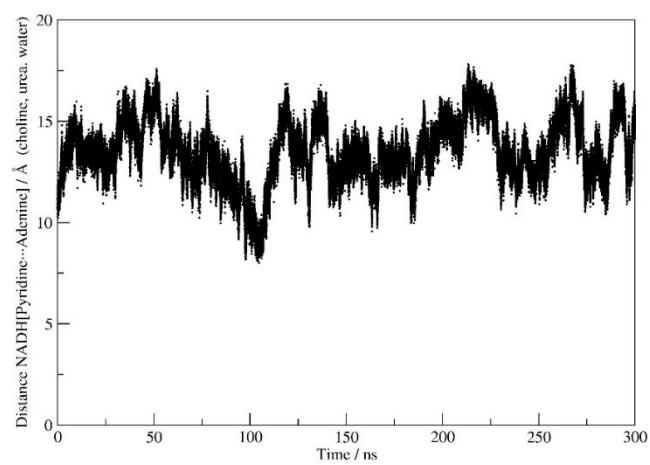

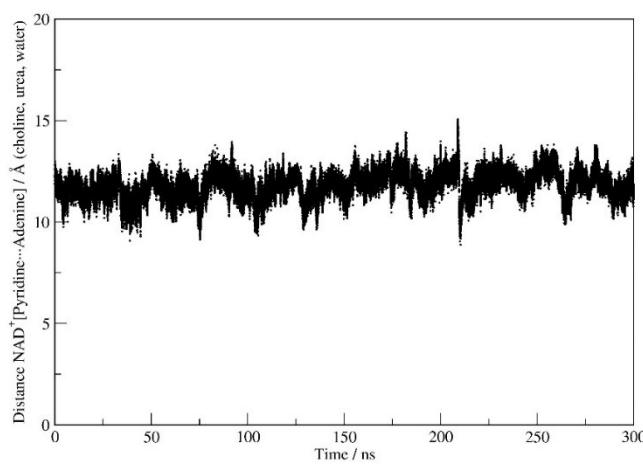

**Figure S4** Representative structures for NAD<sup>+</sup> and NADH in ChCl:Gly following MD simulations. For NAD<sup>+</sup>, two clusters are identified that differ in the orientation of the nicotinamide unit relative to the rotation around the N–C bond connecting it to the ribose fragment. Distance between centers of mass among pyridine and adenine rings (bottom) indicates no hydrophobic π···π stacking interactions at any point during simulations.

**Representative structure #1 (occurrence = 91%)**

**Representative structure #1 (occurrence = 62%)**

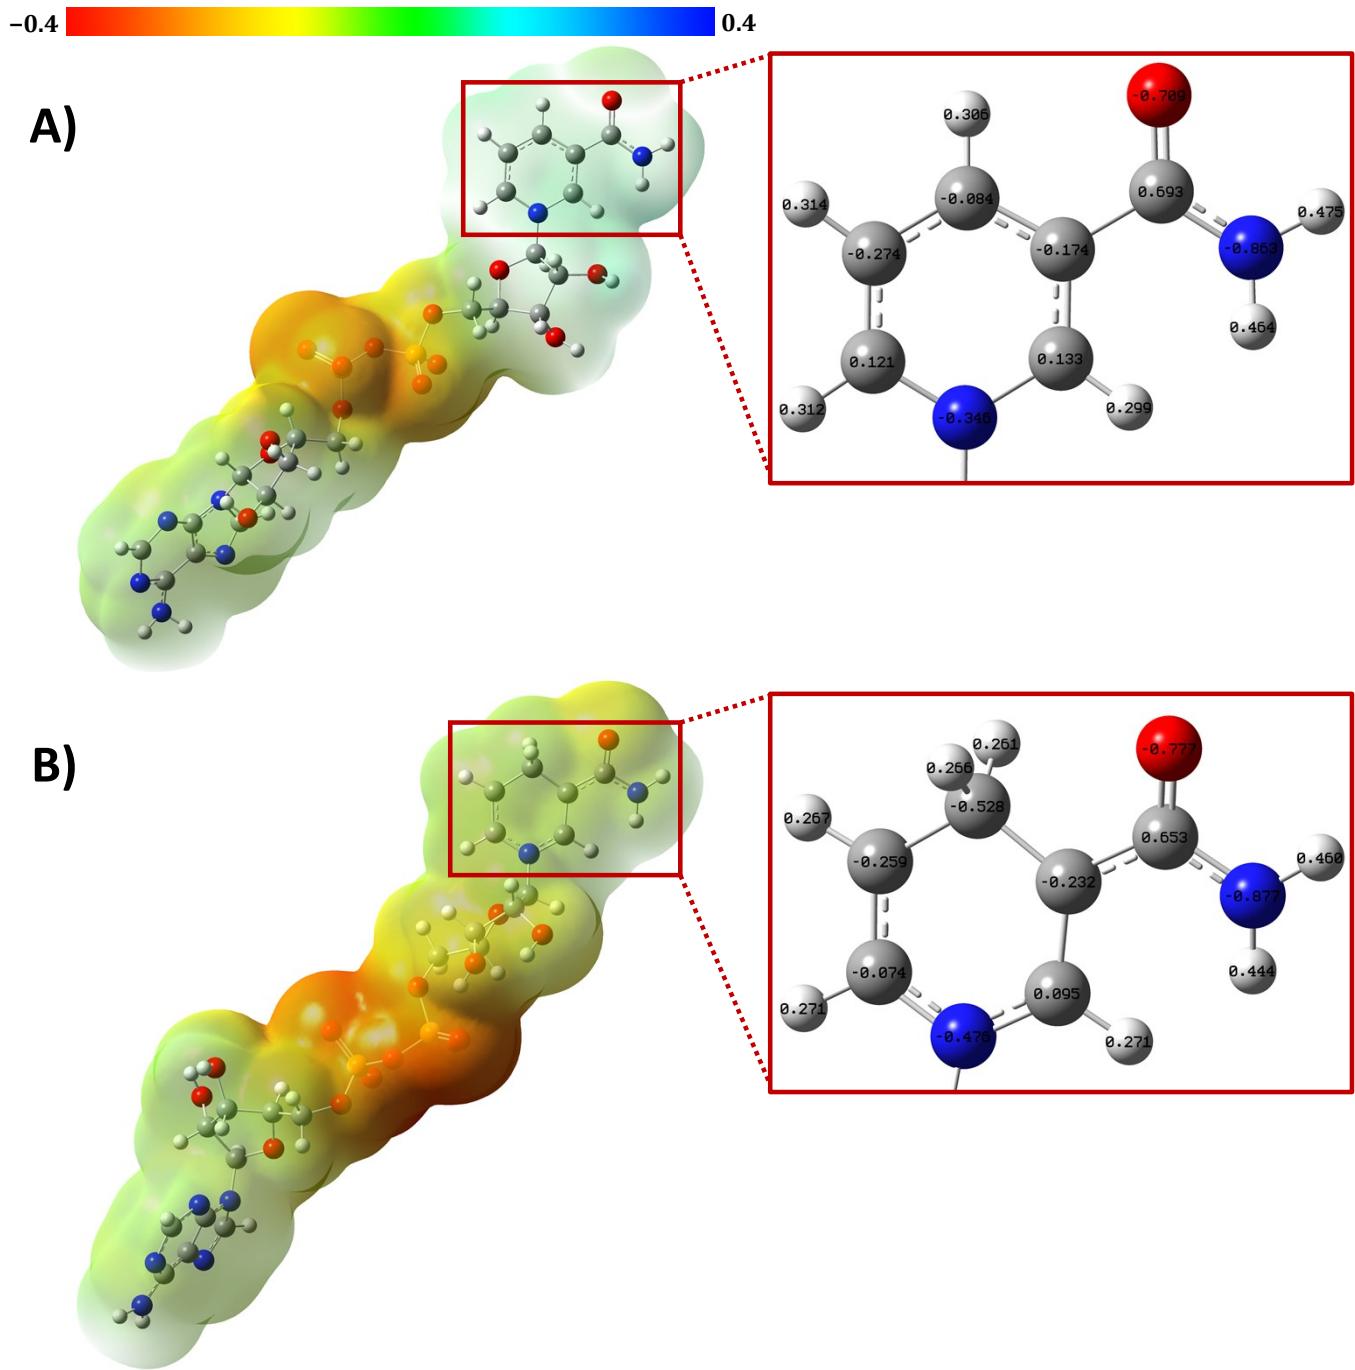

**Figure S5** Representative structures for NAD<sup>+</sup> and NADH in ChCl:U following MD simulations. Distance between centers of mass among pyridine and adenine rings (bottom) indicates no hydrophobic π···π stacking interactions at any point during simulations.

**Table S3** The actual number of hydrogen bonding contacts among 150.000 structures obtained during 300 ns of molecular dynamics simulations in all three investigated environments.

**Figure S6** Distribution of the electronic density around the surface of A) NAD<sup>+</sup> and B) NADH coenzymes, showing the accumulation of the negative charge around phosphate units in both cases, while a comparable total electronic density within the matching nicotinamide fragments, despite an excess positive charge in NAD<sup>+</sup>. This is further confirmed in the inset displays, which show the NBO atomic charges within the nicotinamide fragment, thereby revealing a pronounced delocalization of an excess positive charge in NAD<sup>+</sup> within its six-membered nicotinamide ring, which justifies its reduced effect on the solvation relative to the NADH coenzyme.

**Figure S7** Evolution of distances between the nicotinamide amide N–H and both O-atoms (in black and red) from the nearest  $\text{PO}_2^-$  phosphate unit in  $\text{NAD}^+$  occurring in ChCl:U during 300 ns of MD simulations. The graph indicates an almost persistent hydrogen bonding with one of the phosphate O-atoms (in black) and occasional with the other (in red), which, in total, occur during 88% of the simulation time.

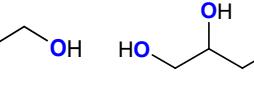

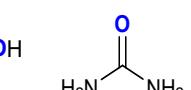

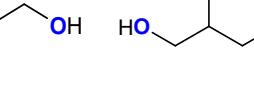

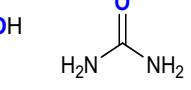

**Table S4** The actual number of hydrogen bonding contacts between the relevant –OH group on the nicotinamide ribose as a donor, and solvent components as acceptors, among 150.000 structures obtained during 300 ns of molecular dynamics simulations.

System:	model phosphodiester + choline
Stationary point:	isolated product2
Structure	<p>The diagram shows a phosphorus atom bonded to two methyl groups (Me) and two oxygen atoms. One oxygen atom is double-bonded to the phosphorus, and the other is single-bonded with a negative charge (⊖). This phosphorus atom is also single-bonded to the nitrogen atom of a trimethylammonium cation, which has a positive charge (⊕).</p>

System:	model NADH with ionized -OH group
Stationary point:	isolated product2
Structure	 A chemical structure diagram showing a five-membered ring. One carbon atom is bonded to two oxygen atoms, one of which has a positive charge (O+) and the other has a negative charge (O-). A hydrogen atom is bonded to another carbon atom in the ring, which is also bonded to the first carbon.
M06-2X/6-31+G(d) energy (in a.u.):	-420.821263358
Thermal correction to Gibbs Free Energy (in a.u.):	0.101384
Number of imaginary frequencies:	0
