S1 General Information

Unless otherwise noted, all reactions of substrates preparation were conducted in flame-dried glassware under a nitrogen atmosphere using anhydrous solvent passed through an activated alumina column (Innovative Technology). Commercially available reagents were used without further purification. Thin layer chromatography (TLC) was performed using Huanghai TLC silica gel plates HSG F254 and visualized using UV light, anisaldehyde or potassium permanganate. The photocatalytic reactions were performed on WATTCAS Parallel Light Reactor (WP – TEC – 1020L) with 10W LED. $^1$H and $^{13}$C NMR spectra were recorded in CDCl$_3$ on a Bruker 400M spectrometer. Chemical shifts in $^1$H NMR spectra were reported in parts per million (ppm) on the $\delta$ scale from an internal standard of residual CDCl$_3$ (7.26 ppm). Data for $^1$H NMR were reported as follows: chemical shift, multiplicity ($s =$ singlet, $d =$ doublet, $t =$ triplet, $q =$ quartet, $m =$ multiplet, $br =$ broad), coupling constant in Hertz (Hz) and integration. Data for $^{13}$C NMR spectra were reported in terms of chemical shift in ppm from the central peak of CDCl$_3$ (77.00 ppm). ESI mass spectra were obtained from an HPLC – Q – Tof mass spectrometer using acetonitrile as the mobile phase. UV – vis spectra were collected on an HP 8453 spectrometer. The fluorescence emission spectra were collected on an Edinburgh FS920.
The photocatalytic reactions were performed on WATTCAS Parallel Light Reactor (WP – TEC – 1020L).

Emission spectra of the 10 W blue LED lamp (maximum emission at $\lambda = 455$ nm). Wavelength: 450 nm-455 nm Quartz glass was used as a reaction vessel. Distance between the light source and quartz tube was approximately 0.5 cm and no filter was used for the reaction.
S3 General Procedure of Allylation

Following the standard procedure, a solution of 1 (0.5 mmol, 1 eq.), alkene 2 (1.5 mmol, 3 eq.), CoCl₂ (10 mol%), dtbbpy (10 mol%), K₃PO₄ (20 mol%) and 4CzIPN (2 mol%) in DMF (0.2 M). The reaction mixture was stirred at room temperature with irradiation of 10 W 450 nm LED for 72 h. After completing, the reaction mixture was concentrated under vacuum rotary evaporation. The obtained residue crude reaction mixture was purified by column chromatography on Silica gel (PE/EtOAc) to afford the corresponding compounds. The ¹H NMR analysis of the crude product was calculated using dimethyl terephthalate as the internal standard.

Big scale synthesis of 4b

In a flame-dried 100 mL Schlenk flask equipped with a magnetic stirrer bar was charged sequentially with CoCl$_2$ (65.0 mg, 0.5 mmol), ligand L$_1$ (134.0 mg, 0.5 mmol). The Schlenk flask was transferred to an argon-filled glovebox and followed by the addition of DMF (25 mL). Then the mixture was stirred at room temperature for 2 h. To the resulting mixture were added 4-Biphenylcarboxaldehyde (911.1 mg, 5 mmol), 2a (2.67 g, 15 mmol), 4CzIPN (78.8 mg, 0.1 mmol) and K$_3$PO$_4$ (212.2 mg, 1.0 mmol). Next, the resulting mixture was removed out the glovebox. At last, the reaction mixture was stirred at a distance of ~5 cm from 10 W LEDs (450 nm) at room temperature about 4 d, the crude material was purified by flash column chromatography to furnish the desired product (87%, 1.56 g).

Figure S2. Condition-based-sensitivity radar diagram

The obtained results for the condition-based sensitivity assessment showed that this reaction was sensitive to the presence of oxygen and water and low irradiation intensity. Significant inhibition of reactivity was observed when the air was injected directly into the reaction mixture (Table S6, entry 5).
S6 Stern-Volmer Luminescence Quenching Analysis

All samples used in the luminescence quenching-based screening studies were prepared under oxygen-free conditions. The photosensitizer 4CzIPN and potential quenchers were weighed into vials and placed inside a glovebox under a positive pressure of nitrogen. DMF was degassed by nitrogen sparging for one hour and also placed inside along with micropipettes and their tips, cuvettes, empty vials, waste containers, and parafilm. Stern-Volmer luminescence quenching studies were carried out using 1.0 × 10⁻⁵ M solution of 4CzIPN and variable concentrations of 4-allyl-1,2-dimethoxybenzene and CoCl₂/dtbbpy in degassed and dried DMF at room temperature under a nitrogen atmosphere. The samples were prepared in screw-top 4.5 cm quartz cuvettes, equipped with PTFE stopper, and sealed with parafilm inside a nitrogen-filled glovebox. The solutions were irradiated at 440 nm and the luminescence was measured at 520 nm. The ratio of I₀/I was plotted as a function of the quencher concentration (I₀ = emission intensity of the photocatalyst in isolation at the specified wavelength; I = observed emission intensity of the photocatalyst with added quencher). The results verify that 4-allyl-1,2-dimethoxybenzene and CoCl₂/dtbbpy quench the 4CzIPN effectively.
**Figure S3.** 4CzIPN emission quenching by CoCl₂ and dtbbpy.

**Figure S4.** 4CzIPN emission quenching by 4-allyl-1,2-dimethoxybenzene.
S7 UV-Vis Studies

Firstly, CoBr₂ (10 mol%), L₁ (10 mol%), and 4CzIPN (2 mol%) were added to DMF (2.5 mL, 0.2 M) resulting in a green mixture (solution a). Then, the alkene (3 eq.) was added. The reaction mixture was stirred at room temperature under irradiation of 10W 450 nm LED for 5h. The mixture was turned to brown (solution b).

In a glove-box, to a 20 mL oven-dried glass vial CoBr₂ (2.4 mg, 10⁻³ M), dtbbpy (2.6 mg, 10⁻³ M) and DMF (10 mL) were added. The solution was allowed to stir for 2 h in the glove-box. Then, take out 3 ml of this solution from the dried glass vial and put it into a cuvette with a spiral cap. 4CzIPN (1.1 mg, 5*10⁻⁴ M) and K₃PO₄ (1.3 mg, 5*10⁻⁴ M) were added. Finally, 2a (16.0 mg, 3*10⁻² M) was added to the solution. The cuvette was removed from the glove box and illuminated with a 450 nm LED light. The cuvette was placed in uv-vis and scanned at wavelengths ranging from 800nm to 200nm over time.

Figure S5. UV-vis spectroscopy studies of cobalt species in the reaction
S8 TEMPO Trapping Experiment

Verification of the formation of allyl radical, generated through reductive quenching of the photocatalyst, was tried via a radical trapping experiment by addition of TEMPO (2,2,6,6-tetramethyl-1-piperidinyloxy, free radical).

\[
\begin{align*}
\text{Ph\(\text{-CHO}\)} & \quad \text{MeO} \quad \text{MeO} \quad \text{Ph}\quad \text{CHO} \\
\text{4-Biphenylcarboxaldehyde} & \quad \text{2a}
\end{align*}
\]

CoCl\(_2\) (6.5 mg, 0.05 mmol, 10 mol\%) and dtbbpy (13.4 mg, 0.05 mmol, 10 mol\%) in DMF were pre-stirred for two hours in an argon-filled glovebox. Then to an oven-dried screw-cap 10 mL reaction tube was added 4CzIPN (7.9 mg, 0.01 mmol, 2 mol\%), K\(_3\)PO\(_4\) (21.2 mg, 0.1 mmol, 20 mol\%), 4-Biphenylcarboxaldehyde (91.1 mg, 0.5 mmol, 1.0 equiv) and TEMPO (234.4 mg, 1.5 mmol, 3.0 equiv). The vial was transferred to an argon-filled glovebox, and the above CoCl\(_2\) and dtbbpy in DMF was added. After sealing with Teflon-lined septa and removing the tube from the glovebox, 4-allyl-1,2-dimethoxybenzene (267.2 mg, 1.5 mmol, 3.0 equiv) was added. The reaction mixture was stirred and irradiated with 10 W blue LED for 24 h. The reaction mixture was analyzed by HRMS.

HRMS (ESI) [M+H]\(^+\) calculated for C\(_{20}\)H\(_{32}\)NO\(_3\): 334.2377, found: 334.2375.

Diastereomeric ratios were determined by 1H NMR spectroscopy of crude products. The two diastereoisomers are difficult to completely separate by column chromatography, but the partially pure major product can be isolated for characterization.

The following substrates were used for the products of 5h, 5i, 5j, 5a-c, and 5d.
