Material and Methods
NMR spectra were acquired at room temperature on an Advance DRX 400 Spectrometer (Bruker, Billerica, MA, USA). HRMS was recorded on an LTQ-Orbitrap-XL (Thermo Scientific, Dreieich, Germany) equipped with a HESI source (Thermo Scientific, Dreieich, Germany) in positive mode.

Experimental Data
S1: Synthesis of 1-methylnicotinamide iodide ([C₁CONH₂Py][I])

2 g of nicotinamide were dissolved in 20 mL MeOH followed by the addition of 3 mole equivalents of MeI. The reaction vessel was sealed and left for 72h at room temperature without stirring. After 72h, yellow crystals had formed which were removed by filtration, washed with cold MeOH and dried in vacuo. The product was obtained as pale-yellow crystals (3.55 g, 82%). Melting point 207-209°C (Lit. 207-211°C). HRMS, C₇H₉IN₂O, calculated m/z 137.0709 [M-I]⁺, found m/z 137.0712, ∆ m/z 2.19 ppm. ¹H-NMR (400 MHz, D₂O) δ = 4.39 (s, 3H), 8.08-8.12 (dd, 3J = 8.1, 6.1 Hz, 1H), 8.79-8.81 (d, 3J = 8.2 Hz, 1H), 8.88-8.90 (d, 3J = 6.1 Hz, 1H), 9.20 (s, 1H) ppm. ¹³C-NMR (101 MHz, D₂O) δ = 48.63, 128.03, 133.48, 143.59, 145.15, 147.28, 165.77 ppm.

S2: Synthesis of 1-methylnicotinium iodide ([C₁mPyRPy][I])

The synthesis of [C₁mPyRPy][I] has already been reported by Heckel et al. and was performed according to the literature with minor modifications.² 10 g of S-nicotine were dissolved in 65 mL acetic acid. After the solution cooled down to room temperature 2 mole equivalents of MeI were added and the sealed reaction vessel was left without stirring for 72h at room temperature. After 72h the solvent and MeI were removed by rotary evaporation, 150 mL Et₂O were added, and residual acetic acid and S-nicotine were filtered off with the Et₂O. The remaining solid was treated with saturated Na₂CO₃ solution until pH 8 was reached. Thereafter, the aqueous layer was removed by rotary evaporation and the residue was extracted with 3x 200 mL CHCl₃ for 2h under reflux. The organic extracts were combined, dried with Na₂SO₄ and evaporated under vacuum. The obtained solids were recrystallized from acetone yielding 6.33 g (34%) of orange crystals of [C₁mPyRPy][I].

Melting point 165-166°C (Lit. 165-165.5°C ³). HRMS, C₁₁H₁₇I₂N₂, calculated m/z 177.1386 [M-I]⁺, found m/z 177.1387, Δ m/z 0.56 ppm. ¹H-NMR (400 MHz, D₂O) δ = 1.69-1.79 (m, 1H), 1.83-1.90 (m, 2H), 2.10 (s, 3H), 2.25-2.32 (m, 1H), 2.33-2.40 (q, 3J = 9.3 Hz, 1H), 3.07-3.12 (m, 1H), 3.41-3.46 (t, 3J = 8.5 Hz, 1H), 4.28 (s, 3H), 7.91-7.95 (dd, 3J = 8.1 Hz, 6.1 Hz, 1H), 8.37-8.39 (d, 3J = 8.2 Hz, 1H), 8.60-8.62 (d, 3J = 6.1 Hz, 1H), 8.63 (s, 1H) ppm. ¹³C-NMR (101 MHz, D₂O) δ = 21.98, 33.50, 39.12, 48.10, 56.31, 67.28, 127.93, 143.15, 144.05, 144.15, 144.26 ppm. ¹⁵N-NMR (41 MHz, D₂O) δ = −176.97, −318.68 ppm.

S3: Synthesis of 1,1′-dimethylnicotinium diiodide ([C_{1}mPyrPy][I]_{2})

To 1 g S-nicotine 10 mole equivalents of MeI were added in a sealed reaction vessel and left without stirring for 72h at room temperature. After evaporation of residual MeI, the solids were washed with Et_{2}O and recrystallized from MeOH-Et_{2}O yielding 1.72 g (62%) of pale-yellow crystals. Melting point 214-215°C. HRMS, C_{12}H_{20}I_{2}N_{2}, calculated m/z 96.0808 [M-I_{2}]^{2+}, found m/z 96.0811, Δ m/z 3.12 ppm. \(^1\)H-NMR (400 MHz, D_{2}O) δ = 2.30-2.38 (m, 2H), 2.63-2.69 (m, 2H), 2.84 (s, 3H), 3.15 (s, 3H), 3.72-3.80 (m, 1H), 3.84-3.90 (m, 1H), 4.40 (s, 3H), 4.97-5.02 (t, \(^3\)J = 9.7 Hz, 1H), 8.15-8.19 (dd, \(^3\)J = 6.1 Hz, 8.2 Hz, 1H), 8.76-8.78 (d, \(^3\)J = 8.3 Hz, 1H), 8.93-8.94 (d, \(^3\)J = 6.1 Hz, 1H), 9.14 (s, 1H) ppm. \(^13\)C-NMR (101 MHz, D_{2}O) δ = 18.99, 26.10, 45.47, 48.82, 51.00, 67.15, 74.50, 128.75, 130.28, 147.19, 147.41 ppm. \(^15\)N-NMR (41 MHz, D_{2}O) δ = -173.95, -305.02 ppm.
