Figure S1. (a) Flow velocity and (b) shear rate profiles in the cross-sectional area of 225 μm microchannels at the average velocity of 40μm s⁻¹.
Figure S2. (a) Flow velocity and (b) shear rate profiles in the cross-sectional area of 225 μm microchannels at the average velocity of 130μm s⁻¹.
Figure S3. (a) Flow velocity and (b) shear rate profiles in the cross-sectional area of 50 μm microchannels at the average velocity of 55 μm s⁻¹.
Figure S4. (a) Flow velocity and (b) shear rate profiles in the cross-sectional area of 50 μm microchannels at the average velocity of 98 μm s⁻¹.
Figure S5. (a) Flow velocity and (b) shear rate profiles in the cross-sectional area of 50 μm microchannels at the average velocity of 128 μm s⁻¹.

Figure S6. Representative time-lapsed images of sperm oriented parallel to the flow.

Figure S7. Representative time-lapsed images of sperm oriented tilted to the flow.
**Figure S8.** Representative (a) straight rheotaxis sperm (b) left-turning rheotaxis sperm, and (c) right-turning rheotaxis sperm alignment direction with respect to the flow direction. Black arrow, red arrow, and blue arrow specify flow direction, sperm moving direction, and sperm orientation angle.

**Figure S9.** Percentage of sperm oriented parallel to the flow in 225-μm-wide microchannels in a flow field with an average velocity of (a) 40 μm s\(^{-1}\), (b) 70 μm s\(^{-1}\) and (c) 130 μm s\(^{-1}\).
Figure S10. Comparison of (a) Curvilinear velocity (VCL), (b) Average path velocity (VAP) and (c) Lateral head displacement (ALH) of bull sperm samples cultured at 37 °C and 38.5 °C. All data represented as mean ± s.d from three independent experiments performed using different samples. p-values were determined by unpaired t test with welch’s corrections.

Figure S11. Relative position of the microfluidic channel and SAW propagation path.
Figure S12. Acoustic streaming in the droplet (a) entirely present on SAW propagation path, (b) partially present on SAW propagation path, and (c) absent on SAW propagation path.
