*Study of the Diels-Alder reactions of cyclohexadiene **22** with ethylene **16**, DCE **17**, and CKA **9**.*

The Diels-Alder (DA) reactions of cyclohexadiene (CHD) **22** with ethylene **16**, DCE **17**, and CKA **9** were also studied as energy references for the [4+2] cycloadditions of the CHT derivatives **1,13-15**. The stationary points involved in these DA reactions are represented in Scheme S1, while the gas phase total and relative energies are given in Table S1.

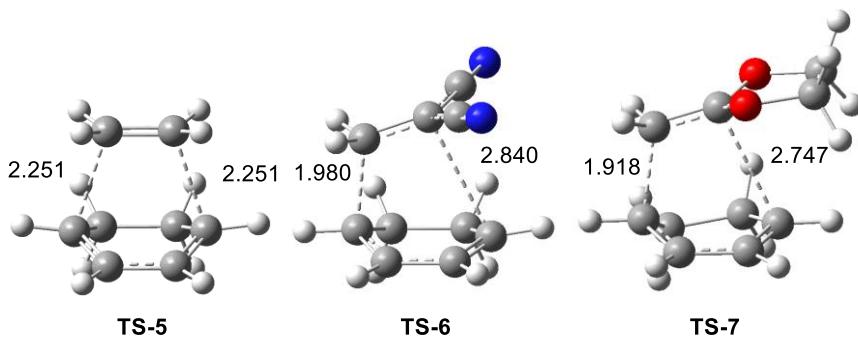

**Scheme S1.** DA reactions of CHD **22** with ethylene **16**, DCE **17**, and CKA **9**.

Some appealing conclusions can be obtained from the relative energies given in Table S1: i) the non-polar DA (N-DA) reaction of CHD **22** with ethylene **16** presents a very high activation energy of 20.0 kcal·mol<sup>-1</sup> because of the non-polar character of the reaction (see later). This activation energy is closer to that for the N-DA reaction between butadiene **26** and ethylene **16**, 21.3 kcal·mol<sup>-1</sup> (see Figure S2); ii) the polar (P-DA) reaction of CHD **22** with DCE **17** presents a very low activation energy of only 7.2 kcal·mol<sup>-1</sup>. The considerable reduction of this activation energy with respect to that with ethylene **16** is a consequence of the high polar of the reaction, resulting from the strong electrophilic character of DCE **17** and the strong nucleophilic character of CHD **22** (see Table 2); iii) the N-DA reaction of CHD **22** with CKA **9** presents a activation energy even higher than the unfavorable N-DA reaction with ethylene **16**, 24.2 kcal·mol<sup>-1</sup>, as a consequence of the high nucleophilic character of the two species; iv) the three DA reactions as strongly exothermic by more than -39.2 kcal·mol<sup>-1</sup>. Consequently, these DA reactions can be considered irreversible; finally, v) the substitution on the ethylene only affects the kinetics of the reactions as the thermodynamics remain unchanged.

**Table S1.**  $\omega$ B97X-D/6-311G(d,p) total (E, in au) and relative ( $\Delta E$ , in  $\text{kcal}\cdot\text{mol}^{-1}$ ) energies of the stationary points involved in the cycloaddition reaction of cycloaddition reactions of CHD **22** with ethylene **16**, DCE **17**, and CKA **9**.

The geometries of the three TSs are given in Figure S1. **TS-5**, with C–C distances between the four interacting carbons of 2.251 Å, is associated with a synchronous C–C single bond formation process. These distances are very similar to those found in the TS of the N-DA reaction between butadiene **26** and ethylene **16**, 2.243 Å (see Figure S2). The C–C distances between the four interacting carbons at **TS-6**, 1.980, and 2.840 Å, indicate that this TS corresponds with a high asynchronous single bond formation process characterized by the nucleophilic attack of one terminal carbon of the diene system of CHD **22** on the  $\beta$ -conjugated position of DCE **17**, which corresponds with the most electrophilic center of this molecule. Finally, these C–C distances at **TS-7**, 1.918, and 2.747 Å, indicate that this TS also corresponds with a high asynchronous single bond formation process. At these unfavorable TSs, the shorter distance corresponds with the most nucleophilic center of CKA **9**.

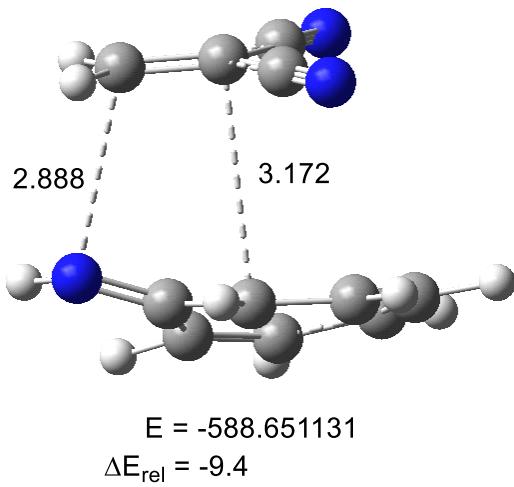

**Figure S1.**  $\omega$ B97X-D/6-311G(d,p) geometries of the TSs involved in cycloaddition reactions of CHD22 with ethylene **16**, DCE **17**, and CKA **9**. The distances are given in Angstroms Å.

Analysis of GEDT at TSs associated with these three DA reactions permits assessment of the polar character of these cycloaddition reactions. GEDT values lower than 0.05 e correspond with non-polar processes, while values higher than 0.20 e correspond with polar processes. The GEDT values at the TSs are -0.02 e (**TS-5**), -0.31 e (**TS-6**), and 0.22 e (**TS-7**). These values indicate that while the DA reaction with ethylene **5** is non-polar, those with DCE **17** or CKA **9** have polar nature. The high GEDT found at the most favorable **TS-7** is a consequence of the strong nucleophilic character of CHD **22** and the strong electrophilic character of DCE **17** (see Table 2).

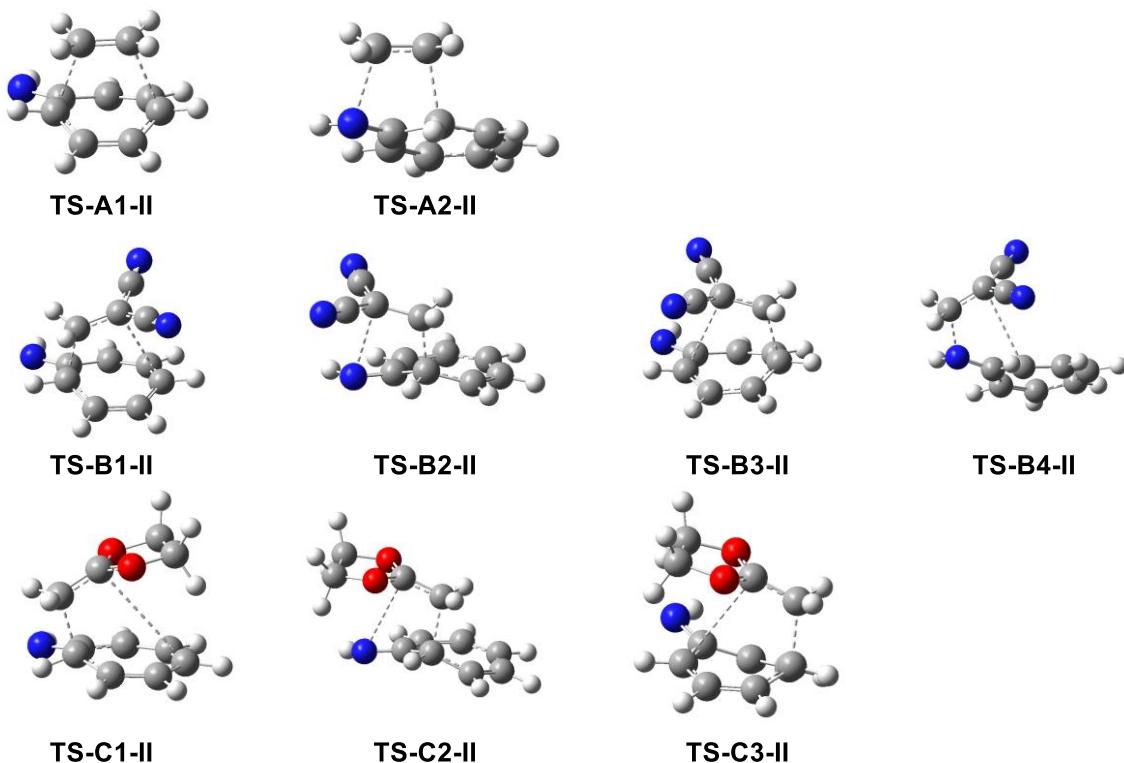

The electronic nature of these ethylene derivatives changes the classification of these DA reactions based on the electron density flux at the TSs: thus, the N-DA reaction with ethylene **16** is classified as the null electron density flux (NEDF), the P-DA reaction with DCE **17** is classified as the forward electron density flux (FEDF), and the P-DA reaction with CKA **9** is classified of the reverse electron density flux (REDF).
