1. General experimental conditions:

Each component of laboratory glassware’s were oven dried and then used for carrying out the general experimental procedures. \(^1\)H-NMR and \(^{13}\)C - NMR spectra were measured on FT-NMR Bruker 400 MHz machine. Whereas some spectra were also analyzed on a JEOL ECS-400 spectrometer which was functioning at 400 MHz for \(^1\)H proton NMR and 100 MHz for \(^{13}\)C \(^1\)H NMR and utilization of CDCl\(_3\) and DMSO-d\(_6\) was done as solvent for preparing the samples. Both Tetramethylsilane (TMS) (0.00 ppm) and CDCl\(_3\) were applied as the internal standards while recording the \(^1\)H proton NMR (\(\delta 7.246\) ppm) and \(^{13}\)C (\(\delta 77.0\) ppm) ]proton NMR. Pattern of the chemical shifts in proton NMR were described in parts per million(ppm). While peak splitting patterns were defined as singlet (s), broad singlet (brs), doublet (d), double doublet (dd), triplet (t), and multiplet (m). All Coupling constant (J) values were stated in Hertz (Hz). High-Resolution Electron Impact Mass Spectra (HR-EIMS) were analyzed on Xevo G2-SQ-Tof (Waters, USA) which are compatible with ACQUITY UPLC® and nano ACQUITY UPLC® systems. Column chromatography was done using a normal (particle size: 100-200 Mesh) and flash (particle size: 230-400 Mesh) silica gel, which were obtained from QualigensTM (India), Spectrochem (India), and Rankem (India). TLC plates coated with silica gel (Kiesel 60-F254, Merck (India)) were used to track the progress of chemical reactions. The visualizing agents which were utilized for TLC were UV light. For drying and concentrating all the solvents, BUCHI’s Rotavapor R-210 was used. All the supplied solvents were of analytical grade such as MeOH, EtOH and they were used without any prior purification. The chemicals and reagents used for the chemical reactions were purchased from Sigma Aldrich chemicals company (USA), TCI (India) Pvt. Ltd., Merck (India), and/or Spectrochem (India) etc. were used without any purification prior to use.

2. Synthesis of Imidazolium salts (HL\(_1\)-Br and HL\(_1\)PF\(_6\)): The novel imidazolium salt (HL\(_1\)-Br) was formed using the methodology depicted in Scheme 2. Previously reported methods were used to prepare 2-(1H-imidazol-1-yl)pyridine and 2-bromo-1-(2-methoxyphenyl)ethan-1-one.\(^9\) HL\(_1\)-Br was synthesized using the known reaction of 2-(1H-imidazol-1-yl)pyridine (280 mg, 1.05 mmol) and 2-bromo-1-(2-methoxyphenyl)ethan-1-one (420mg, 1.0 mmol) in ACN under N\(_2\) atmosphere at 85 °C for 16 h.\(^10\) The result was a colourless solid precipitate. After cooling to room temperature, the reaction mixture was filtered using filter paper. With 2 mL of dry acetonitrile, the leftover solid was washed. To get the ligand in an analytically pure form, the colourless product was dried and then stored in a calcium chloride vacuum desiccator. The bromide anions of the ligand were exchanged to hexafluorophosphate in
water using potassium hexafluorophosphate (1.16 g, 6.3 mmol) in excess. The solid residue that was formed was filtered and rinsed with excess water. To acquire the ligand in an analytically pure form, the colourless compound was first air dried and then stored in a calcium chloride vacuum desiccator for 12 hours. $^1$H NMR, $^{13}$C NMR, and HRMS-mass data were recorded to characterise the ligand.

General procedure for the competition reaction

A mixture of 4-methoxyaniline 1c (0.5 mmol), 4-nitroaniline 1f (0.5 mmol), bromobenzene 2a (0.5 mmol) in the presence of HL$_1$Br (1 mol%) and Cu(OAc)$_2$ (40 mol%) were charged at a temperature of 110 °C for 16 h in a sealed reaction tube. A mixture of aniline 1a (0.5 mmol), 2-phenylethan-1-amine 4e (0.5 mmol), bromobenzene 2a (0.5 mmol) in the presence of HL1-Br (1 mol%) and Cu(OAc)2 (40 mol%) were charged at a temperature of 110 °C for 16 h in a sealed reaction tube. After the completion of the reaction, the reaction mixture was cooled and the work-up was done ethyl acetate (3 × 20 mL). The combined organic layers were dried over anhydrous Na2SO4, filtered, and concentrated under reduced pressure to get the crude residue which was further purified through column chromatography on silica gel (230-400 mesh) using hexane: ethyl acetate (99:1 ratio) as an eluting solvent which afforded the corresponding product 3a in 65 % and 5e in 20 % yields, respectively. The above reaction is repeated by taking a mixture of aniline 1a (0.5 mmol), phenylmethanamine 4a (0.5 mmol), bromobenzene 2a (0.5 mmol) underneath the standard reaction conditions. After usual work-up, the crude residue was purified through silica gel column chromatography (230-400 mesh) using hexane: ethyl acetate (99:1 ratio) as an eluting solvent which afforded the corresponding product 3a in 58 % and 5a in 17 % yields, respectively. Furthermore, a mixture of 2-phenylethan-1-amine 4e (0.5 mmol), pyrrolidine 6a, bromobenzene 2a (0.5 mmol) was charged at standard conditions. After customary work-up, the crude residue was purified through silica gel column chromatography (230-400 mesh) using hexane: ethyl acetate (99:1 ratio) as an eluting solvent which afforded the corresponding product 5e in 50 % and 7a in 38 % yields, respectively.
