## 1. General experimental conditions:

Each component of laboratory glassware's were oven dried and then used for carrying out the general experimental procedures. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}$ - NMR spectra were measured on FT NMR Bruker 400 MHz machine. Whereas some spectra were also analyzed on a JEOL ECS400 spectrometer which was functioning at 400 MHz for ${ }^{1} \mathrm{H}$ proton NMR and 100 MHz for $13 \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR and utilization of $\mathrm{CDCl}_{3}$ and DMSO- $\mathrm{d}_{6}$ was done as solvent for preparing the samples. Both Tetramethylsilane (TMS) ( 0.00 ppm ) and $\mathrm{CDCl}_{3}$ were applied as the internal standards while recording the ${ }^{1} \mathrm{H}$ proton NMR ( $\delta 7.246 \mathrm{ppm}$ ) and ${ }^{13} \mathrm{C}(\delta 77.0 \mathrm{ppm})$ ]proton NMR. Pattern of the chemical shifts in proton NMR were described in parts per million(ppm). While peak splitting patterns were defined as singlet (s), broad singlet (brs), doublet (d), double doublet (dd), triplet (t), and multiplet (m). All Coupling constant (J) values were stated in Hertz (Hz). High-Resolution Electron Impact Mass Spectra (HR-EIMS) were analyzed on Xevo G2-SQ-Tof (Waters, USA) which are compatible with ACQUITY UPLC® and nano ACQUITY UPLC® systems. Column chromatography was done using a normal (particle size: 100-200 Mesh) and flash (particle size: 230-400 Mesh) silica gel, which were obtained from QualigensTM (India), Spectrochem (India), and Rankem (India). TLC plates coated with silica gel (Kiesel 60-F254, Merck (India)) were used to track the progress of chemical reactions. The visualizing agents which were utilized for TLC were UV light. For drying and concentrating all the solvents, BUCHI's Rotavapor R-210 was used. All the supplied solvents were of analytical grade such as $\mathrm{MeOH}, \mathrm{EtOH}$ and they were used without any prior purification. The chemicals and reagents used for the chemical reactions were purchased from Sigma Aldrich chemicals company (USA), TCI (India) Pvt. Ltd., Merck (India), and/or Spectrochem (India) etc. were used without any purification prior to use.
2. Synthesis of Imidazolium salts $\left(\mathbf{H L}_{\mathbf{1}} \mathbf{-} \mathbf{B r}\right.$ and $\left.\mathbf{H L}_{\mathbf{1}} \mathbf{P} \mathbf{F}_{\mathbf{6}}\right)$ : The novel imidazolium salt $\left(\mathbf{H L}_{\mathbf{1}} \mathbf{-}^{-}\right.$ $\mathbf{B r}$ ) was formed using the methodology depicted in Scheme 2. Previously reported methods were used to prepare 2-(1H-imidazol-1-yl)pyridine and 2-bromo-1-(2-methoxyphenyl)ethan1 -one. ${ }^{9} \mathbf{H L}_{1}-\mathbf{B r}$ was synthesized using the known reaction of $2-(1 \mathrm{H}$-imidazol-1-yl)pyridine ( $280 \mathrm{mg}, 1.05 \mathrm{mmol}$ ) and 2-bromo-1-(2-methoxyphenyl)ethan-1-one ( $420 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) in ACN under $\mathrm{N}_{2}$ atmosphere at $85{ }^{\circ} \mathrm{C}$ for $16 \mathrm{~h} .{ }^{10}$ The result was a colourless solid precipitate. After cooling to room temperature, the reaction mixture was filtered using filter paper.With 2 0 mL of dry acetonitrile, the leftover solid was washed. To get the ligand in an analytically pu re form, the colourless product was dried and then stored in a calcium chloride vacuum desiccator. The bromide anions of the ligand were exchanged to hexafluorophosphate in
water using potassium hexafluorophosphate ( 1.16 g , 6.3 mmol ) in excess. The solid residue that was formed was filtered and rinsed with excess water. To acquire the li gand in an analytically pure form, the colourless compound was first air dried and then stored in a calcium chloride vacuum desiccator for 12 hours. ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, and HRMSmass data were recorded to characterise the ligand.

3. General procedure for the synthesis of C-N coupling of variety of Amines (1a-g, 4a-f, 6a-f) with different type of Aryl/Hetero-aryl halides (2a-g/2a'-2b') : A mixture of different type of amines ( $\mathbf{1 a - g}, \mathbf{4 a - f}, \mathbf{6 a - f}$ ) ( 0.5 mmol ) with various aryl/hetero-aryl halides (2a-g/2a'-2b') ( 0.6 mmol ) in the presence of $\mathrm{HL}^{\mathbf{~}} \mathrm{Br}^{-}(1 \mathrm{~mol} \%)$ and $\mathrm{Cu}(\mathrm{OAc})_{2}(40 \mathrm{~mol} \%)$ was charged in a reaction tube at a temperature of $110^{\circ} \mathrm{C}$ for 16 h . After the completion of the reaction, the reaction mixture was cooled and the work-up was done with $\mathrm{H}_{2} \mathrm{O}(15 \mathrm{~mL})$ and ethyl acetate $(3 \times 20 \mathrm{~mL})$. The combined organic layers were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under reduced pressure to get the crude residue which was further purified through column chromatography on silica gel (230-400 mesh) using hexane: ethyl acetate ( $99: 1$ ratio) as eluting solvent to afford the C-N coupling product $\mathbf{3 a - 0}, \mathbf{5 a - f}$ and $\mathbf{7 a - f}$ in 35-93 \% yield.

## General procedure for the competition reaction

A mixture of 4-methoxyaniline $\mathbf{1 c}(0.5 \mathrm{mmol})$, 4-nitroaniline $1 \mathbf{f}(0.5 \mathrm{mmol})$, bromobenzene $2 \mathbf{2 a}(0.5 \mathrm{mmol})$ in the presence of $\mathrm{HL}_{1}-\mathrm{Br}^{-}(1 \mathrm{~mol} \%)$ and $\mathrm{Cu}(\mathrm{OAc})_{2}(40 \mathrm{~mol} \%)$ were charged at a temperature of $110^{\circ} \mathrm{C}$ for 16 h in a sealed reaction tube. After completion of the reaction, the reaction mixture was cooled and the work-up was done with ethyl acetate ( $3 \times 20 \mathrm{~mL}$ ). The combined organic layers were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under reduced pressure to get the crude residue which was further purified through column
chromatography on silica gel (230-400 mesh) using hexane: ethyl acetate (99:1 ratio) as an eluting solvent afforded the corresponding product $\mathbf{3 c}$ in $55 \%$ and $\mathbf{3 f}$ in $30 \%$ yields, respectively. A mixture of aniline $1 \mathbf{1 a}(0.5 \mathrm{mmol})$, 2-phenylethan-1-amine $4 \mathbf{e}(0.5 \mathrm{mmol})$, bromobenzene 2a $(0.5 \mathrm{mmol})$ in the presence of $\mathrm{HL}_{1}-\mathrm{Br}^{-}(1 \mathrm{~mol} \%)$ and $\mathrm{Cu}(\mathrm{OAc})_{2}(40 \mathrm{~mol} \%)$ were charged at a temperature of $110{ }^{\circ} \mathrm{C}$ for 16 h in a sealed reaction tube. After the completion of the reaction, the reaction mixture was cooled and the work-up was done ethyl acetate $(3 \times 20 \mathrm{~mL})$. The combined organic layers were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under reduced pressure to get the crude residue which was further purified through column chromatography on silica gel (230-400 mesh) using hexane: ethyl acetate (99:1 ratio) as an eluting solvent which afforded the corresponding product $\mathbf{3 a}$ in 65 $\%$ and $\mathbf{5 e}$ in $20 \%$ yields, respectively. The above reaction is repeated by taking a mixture of aniline 1a ( 0.5 mmol ), phenylmethanamine $\mathbf{4 a}(0.5 \mathrm{mmol})$, bromobenzene $\mathbf{2 a}(0.5 \mathrm{mmol})$ underneath the standard reaction conditions. After usual work-up, the crude residue was purified through silica gel column chromatography (230-400 mesh) using hexane: ethyl acetate (99:1 ratio) as an eluting solvent which afforded the corresponding product $\mathbf{3 a}$ in 58 $\%$ and $5 \mathbf{a}$ in $17 \%$ yields, respectively. Furthermore, a mixture of 2-phenylethan-1-amine $\mathbf{4 e}$ ( 0.5 mmol ), pyrrolidine $\mathbf{6 a}$, bromobenzene $\mathbf{2 a}(0.5 \mathrm{mmol})$ was charged at standard conditions. After customary work-up, the crude residue was purified through silica gel column chromatography (230-400 mesh) using hexane: ethyl acetate (99:1 ratio) as an eluting solvent which afforded the corresponding product $\mathbf{5 e}$ in $50 \%$ and $\mathbf{7 a}$ in $38 \%$ yields, respectively.
