TableS1 The analysis result of MetGem software

General experimental procedures

Optical rotation was tested on a JASCO DIP-370 digital polarimeter (JASCO, Tokyo, Japan). ECD spectra were measured by a MOS-450 spectrometer (Bio-Logic Science, France). UV spectra were recorded in MeOH using a Shimadzu UV-2600i spectrophotometer (Shimadzu, Tokyo, Japan). The 1D and 2D NMR spectra were recorded on a Bruker AVIII-600 spectrometer (600 and 150 MHz) in CDCl₃ with TMS as an internal standard. HRESIMS data were tested in the positive-ion mode on a Bruker Micro Q-TOF. Chromatographic silica gel (200–300 mesh, Qingdao Marine Chemical Factory, Qingdao, China), Thin-Layer Chromatography (TLC) was carried out on silica gel GF254 (Qingdao Marine Chemical, Inc.), and the vanillin-H₂SO₄ as the developer reagent. Semi-preparative HPLC was performed on a Shimadzu LC-20A with an SPD-20A UV/VIS'S detector and using the column of YMC Pack ODS-A (250 × 10 mm, 5 μm, YMC Company, Kyoto, Japan). Reversed-phase C18 (RP-C₁₈) silica gel (50 μm, Japan) was employed for column chromatography. Reagents and solvents were obtained from commercial supplies. The MTT assays were measured on a Varioskan Flash Multimode Reader (Thermo Scientific Co. Ltd, Massachusetts, USA).

Extraction and isolation

The dried flower buds of *D. genkwa* (60.0 kg) were extracted with 70% EtOH three times. After removal of the solvent under vacuum, the residue was suspended in H₂O and successively extracted with CH₂Cl₂. Subsequently, the CH₂Cl₂ extract was subjected to column chromatography (200–300 mesh) under reduced pressure and subsequent TLC analysis. Then, the CH₂Cl₂ extract was successfully divided into six fractions (Fr. A–Fr. E) by cross-merging. Fr. C (230.0 g) was further subjected to HP-20 and ODS using a mixture of EtOH–H₂O (from 30:70 to 100:0, v/v) to afford four fractions (Fr. C1–C4). Fr. C3 (25.1 g) was separated on a silica gel column eluted with PE-EA and a semi-preparative HPLC to get compound **5** (30.1 mg). Fr. C2 (22.3 g) was purified by a silica gel column and RP-HPLC to obtain compound **2** (4.0 mg) and **3** (10.0 mg). Fr. D (400.0 g) was also further subjected on HP-20 and ODS using a mixture of EtOH–H₂O (from 30:70 to 100:0, v/v) to afford four fractions (Fr. D1–D3).

Through a silica gel column and RP-HPLC, compound **1** (7.5 mg) was obtained from Fr. D1 (15.3 g), compounds **7** (200.3 mg) and **8** (9.2 mg) from Fr. D2, and compounds **4** (10.5 mg) and **6** (9.3 mg) from Fr. D3.

MZmine 2 data preprocessing parameters for global network

Raw files were converted into mzXML (mass spectrometry data format) files using the GNPS_Vendor_Conversion software. Then, mzXML files were processed using MZmine 2.38(Olivon, et al. 2017, Brel, et al. 2020). Mass detection was carried out with a centroid mass detector with the noise level set to 1000 for the MS1 level and 100 for the MS2 level set to all. The ADAP (Automated Data Analysis Pipeline) chromatogram builder was achieved using a minimum group size of scans of 4, a minimum group intensity threshold of 3000, a minimum highest intensity of 3000, and an m/z tolerance of 0.002 or 10.0 ppm. The wavelets (ADAP) algorithm was used for the chromatogram deconvolution with the following settings: S/N threshold of 5, an intensity window SN, a minimum feature height of 300, a coefficient area threshold of 20, a peak duration range between 0 and 1, and an RT wavelet range between 0 and 0.02. Chromatograms were deisotoped using the isotopic peaks grouper algorithm with an m/z tolerance of 0.002 (10 ppm), RT tolerance of 0.2 (absolute), maximum charge of 3, and the representative isotope used was the most intense. Peak alignment was performed using the join aligner method: m/z tolerance of 0.003 or 10 ppm, weight for m/z of 1.00, RT tolerance of 2 min, weight for RT of 1.00. The peak list was gap filled with the peak finder method multithreaded with an intensity tolerance of 30.00, m/z tolerance of 0.02 (10 ppm), and 0.20 for RT tolerance.

Molecular network analysis

After preprocessing the HPLC-HRMS/MS data with MZmine 2.38, the output .mgf file was processed with the MetGem software version 1.3.6 to give a network containing nodes distributed in clusters (Olivon, et al. 2018, Olivon, et al. 2017). Networks were generated using the following parameters: m/z tolerance set to 0.01, minimum matched peaks set to 4, topK set to 10, minimal cosine score value of 0.60,

and max. connected component size of 400. Then, the associated CSV file was loaded. For the mapping process, the relative quantification of each ion was represented by pie chart diagrams for which the proportions were based on the respective areas of the corresponding extracted ion chromatograph areas. Then, the analogues of the spectra in the network were searched in the available spectral libraries. The library spectra were filtered in the same manner as the input data. All the matches between the network spectra and library spectra were required to have a score above 0.6 and at least 4 matched peaks. The m/z tolerance for the analogue search was set to 100. T-SNE visualization was generated using the following parameters: at least 1 cosine score above 0.60; number of iterations, 1000; perplexity, 6; learning rate, 200; early exaggeration, 12; using Barnes-hut approximation with an angle of 0.5.
