## **General Materials and Techniques.**

**General Materials:** Toluene-p-sulfonyl chloride, 1,4-Dimethoxybenzene, Boron trifluoride ether, 1,4-Dibromobutane, 4-Methoxyphenol, Copper sulfate pentahydrate, Sodium ascorbate, 6-Bromohexanenitrile, Sodium hydroxide,  $\beta$ -Cyclodextrin, Tetrakis(4-hydroxyphenyl)ethylene, Polyformaldehyde, Sodium azide, Propargyl bromide, Potassium carbonate and conventional reagents were used as received.

**Techniques:**  $^1\text{H}$ -NMR (300, 500 MHz),  $^{13}\text{C}$ -NMR (75, 125 MHz) and  $^1\text{H}$  NOESY NMR (500 MHz) spectra were recorded on a Bruker AM-300 and AM-500 instrument. The Uv-vis and FL spectra were obtained with JASCO UV-V650 UV-vis and FP-8200 FL spectrometers, respectively. Mass spectroscopy was performed with a Shimadzu AXIMA-CFR matrix-assisted laser desorption/ionization time-of-flight (MALDI-TOF) mass spectrometer. A zetasizer Nano-ZS was used to analyze the size distributions of molecules in aqueous solution. ATR-IR spectra were obtained using a Bruker VERTEX 70 spectrometer. Transmission electron microscope (TEM) experiments: A glow discharge instrument (15mA, 60s) was used to carry out hydrophilic treatment on the carbon support membrane (ordinary carbon support membrane, 200 mesh, Beijing China Lens Science and Technology Co., LTD.), and then 3  $\mu\text{L}$  samples of  $\text{H}_2\text{O}$ /DMSO solution and  $\text{CHCl}_3$ /DMSO solution were added to the treated and untreated carbon support membranes by drops respectively, standing at room temperature. After drying, 3  $\mu\text{L}$  uranyl acetate aqueous solution (0.4 wt %) was used for staining. After standing for one minute, absorb the excess dye solution, and dry again at room temperature, the carbon support membrane can be placed in the sample

tank for testing. Transmission electron microscope (TEM) images were measured by JEOL's high resolution TEM (JEM-2100 Plus), using an accelerated voltage of 120kV. Atomic force microscope (AFM) experiments: The whole layer of mica was completely peeled off with plastic tape (Scotch), and the freshly peeled mica (10×20 mm) was placed on the surface dish, drop 5μL of the solution to be tested was added to the mica by drip casting method, and the mica was taken out and placed on the sample table for testing after being dried at room temperature for 12 hours. The test mode was adopted ACAFM mode.

#### Association constant determination for $\text{H}_3 \supset \text{G}$ in $\text{CDCl}_3$

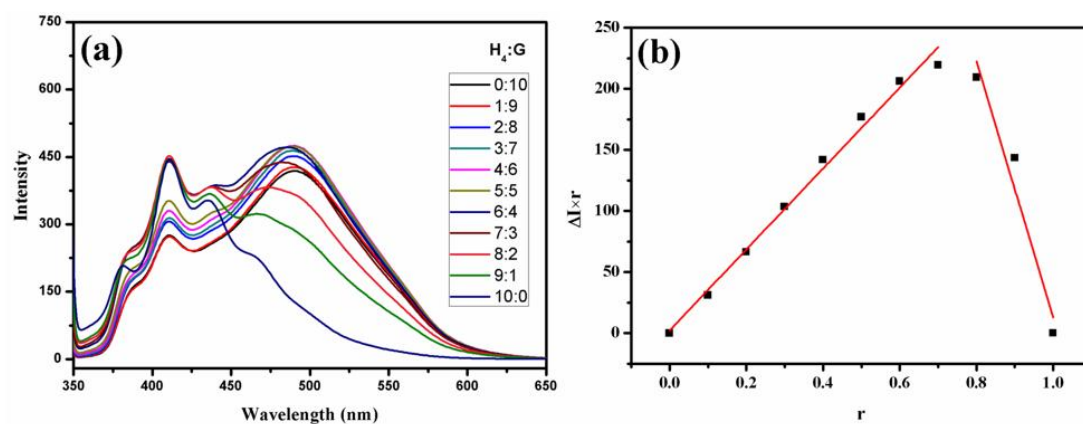

In order to further determine the association constant and stoichiometry of  $\text{H}_3 \supset \text{G}$ , FL titration and continuous Job's variation method was done<sup>[3]</sup>.

Stoichiometry ( $n$ ) and apparent binding constant ( $K$ ) were calculated according to Benesi - Hildebrand equation,  $1/\Delta X = 1/\alpha + 1/\alpha K[\text{Host}]^n$  with the plot of  $1/\Delta X$  vs  $1/[\text{Host}]^n$  determined by fluorescent.

Where  $\Delta X$  is the changes of fluorescent emission intensity ( $\Delta I$ ), As shown in Figure S39, the plot of  $1/\Delta I$  vs  $1/[\text{Host}]^4$  has a good linear least-squares fit with a better correlation coefficient than that of the plot of  $1/\Delta I$  vs  $1/[\text{Host}]^n$  ( $n=1,2,3$ ), indicating that the stoichiometry of the inclusion complex between **H<sub>3</sub>** and the compound **G** is 4 : 1. The stoichiometry was also confirmed by the continuous Job's variation method (Job's plot) as shown in Figure S40.

**Figure S39** (a) Fluorescent spectra of the complex of  $\mathbf{H}_3$  and  $\mathbf{G}$  (curves from top to bottom, molar ratios = 0 : 1, 2 : 1, 3 : 1, 4 : 1, 6 : 1, 8 : 1, 12 : 1, 16 : 1, 20:1) in  $\text{CDCl}_3$  solution ( $\sim 5.0 \times 10^{-5} \text{ mol L}^{-1}$ ), excited at 343 nm. (b) The plot of  $I / \Delta I$  vs  $I / [\mathbf{H}_3]$  detected by fluorescent intensity at 500 nm.  $K = 1.18 \times 10^5 \text{ M}^{-1}$ ,  $R = 0.7280$ . (c) The plot of  $I / \Delta I$  vs  $I / [\mathbf{H}_3]^2$  detected by fluorescent intensity at 500 nm.  $K = 1.19 \times 10^9 \text{ M}^{-2}$ ,  $R = 0.9060$ . (d) The plot of  $I / \Delta I$  vs  $I / [\mathbf{H}_3]^3$  detected by fluorescent intensity at 500 nm.  $K = 1.21 \times 10^{13} \text{ M}^{-3}$ ,  $R = 0.9749$ . (e) The plot of  $I / \Delta I$  vs  $I / [\mathbf{H}_3]^4$  detected by fluorescent intensity at 500 nm.  $K = 1.22 \times 10^{17} \text{ M}^{-4}$ ,  $R = 0.9926$ .
