## 2. Nanopore fabrication and the diameter estimate

Nanopipette fabrication: Quartz capillaries (QF100-50-10), with an outer diameter of 1.0 mm and inner diameter of 0.5 mm were obtained from Sutter Instrument. All glass capillaries were thoroughly treated by immersion in freshly prepared piranha solution (98% H<sub>2</sub>SO<sub>4</sub> : 30% H<sub>2</sub>O<sub>2</sub> = 3:1 v/v) for approximately 2 h. The capillaries were then thoroughly rinsed with deionized water and ethanol several times and dried under N<sub>2</sub> gas. Before use, the cleared capillaries were dried at 80 °C for 1 h. A CO<sub>2</sub>-laser P-2000 puller system (Sutter Instruments Co. Ltd) was used to fabricate the nanopipette with the following settings: Heat = 760, Fil = 4, Vel = 29, Del = 140, and Pull = 168. The tip diameters of the nanopipettes were approximately 20 nm and were characterized by SEM and ionic conductance.

The diameter estimate: The electrochemical measurement to estimate the nanopore diameter according to the classical equation (S1).<sup>[S1]</sup>

$$a = \frac{1}{\pi k R \tan \theta / 2} \quad (\text{Equation S1})$$

R is the measured nanopipette resistance, *k* is the specific resistance of the electrolyte used (*k*= 7.6 S/m in 1M LiCl), *θ* is the cone angle (*θ*=18° in Figure S1b), *a* is the diameter of the nanopore at the tip of the nanopipette.

**Figure S3.** (a) The I-V response of the 5 different nanopipettes (1 M LiCl, 10 mM Tirs-HCl, pH 7.4); (b) Scanning electron microscope image of the presented nanopipette.

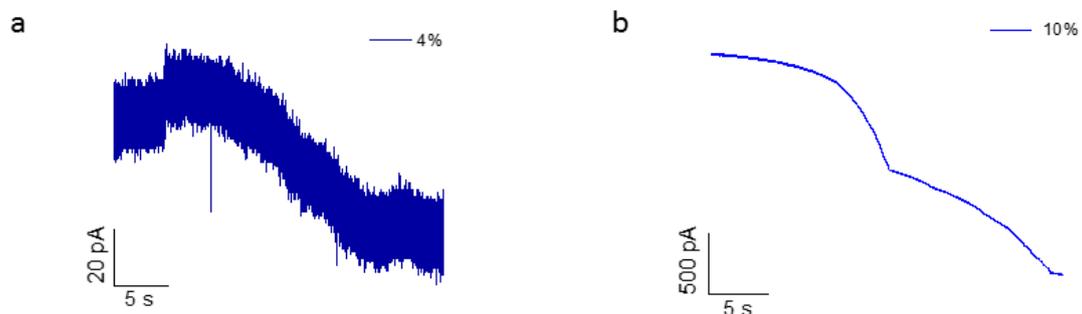

### 1 3. Calculation of the baseline fluctuation

2 The baseline fluctuation is quantitatively expressed as  $I_{RMS}$ , which is directly calculated  
3 as the following:

$$4 \quad I_{RMS} = \sqrt{\Delta I^2(t)} \quad \text{(Equation S2)}$$

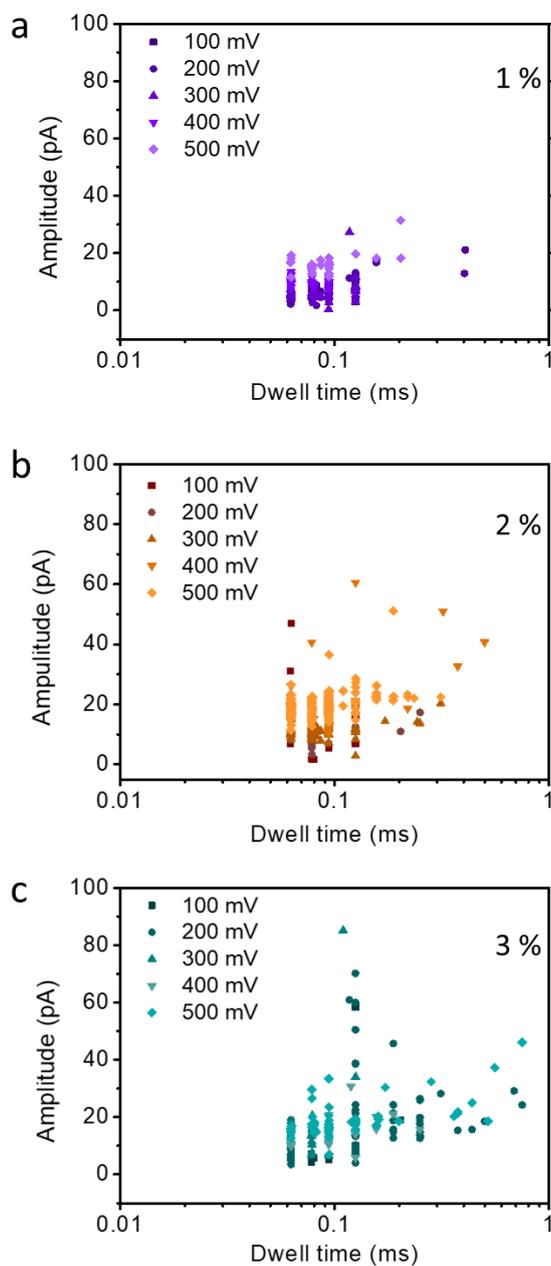

5 The root-mean-square (RMS) noise  $I_{RMS}$  is the electrical current through the pore, and  
6  $\Delta I(t)$  represents the fluctuation of the current  $I(t)$  deviating from its mean value. [S2]  
7

## 1 14. TPE-COOH concentration optimization

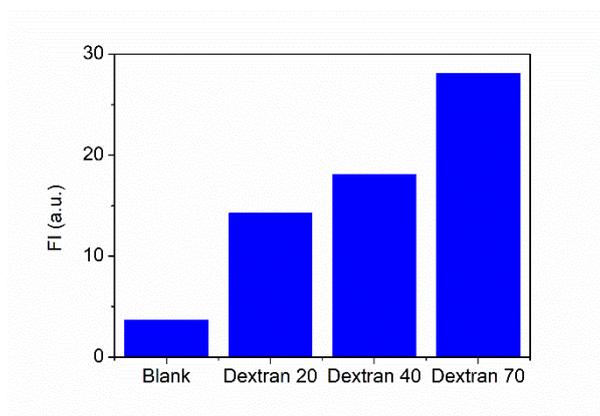

2 Stock solutions of dextran 20 (1  $\mu\text{M}$ ), dextran 40 (1  $\mu\text{M}$ ), dextran 70 (1  $\mu\text{M}$ ), and  
3 PEI<sub>1800</sub>-oBA (10 mg/mL) were prepared using 1 M LiCl (10 mM Tris-HCl, pH 7.4). A  
4 stock solution of TPE-COOH (1 mM) was prepared with DMF. All of the solutions  
5 were diluted with 1M LiCl (10 mM Tris-HCl, pH 7.4) before use. For TPE-  
6 COOH/PEI<sub>1800</sub>-oBA mixtures fluorescence detection, different concentrations of TPE-  
7 COOH were mixed with 3% PEI<sub>1800</sub>-oBA in 96-well plates.

8 Figure S8 shows the fluorescence imaging and intensity of different concentrations  
9 of TPE (10-50  $\mu\text{M}$ ) in 1 M LiCl mixed with PEI<sub>1800</sub>-oBA (3%). With increasing TPE  
10 concentration, the fluorescence intensity increased. Thus, the TPE-COOH /PEI<sub>1800</sub>-  
11 oBA complex formed by TPE-COOH adsorbs on the surface of PEI<sub>1800</sub>-oBA. The  
12 fluorescence intensity curve suggested that 3% PEI<sub>1800</sub>-oBA needed 40  $\mu\text{M}$  TPE-  
13 COOH to reach saturation.

14  
15 **Figure S12.** (a) The fluorescence image and (b) the corresponding fluorescence intensity of 1  $\mu\text{M}$   
16 dextran 70 and 3 % PEI<sub>1800</sub>-oBA complex with different concentration of TPE-COOH (10, 20, 30,  
17 40, and 50  $\mu\text{M}$ ).

1 **15. Fluorescence intensity sum in Figure 4b**

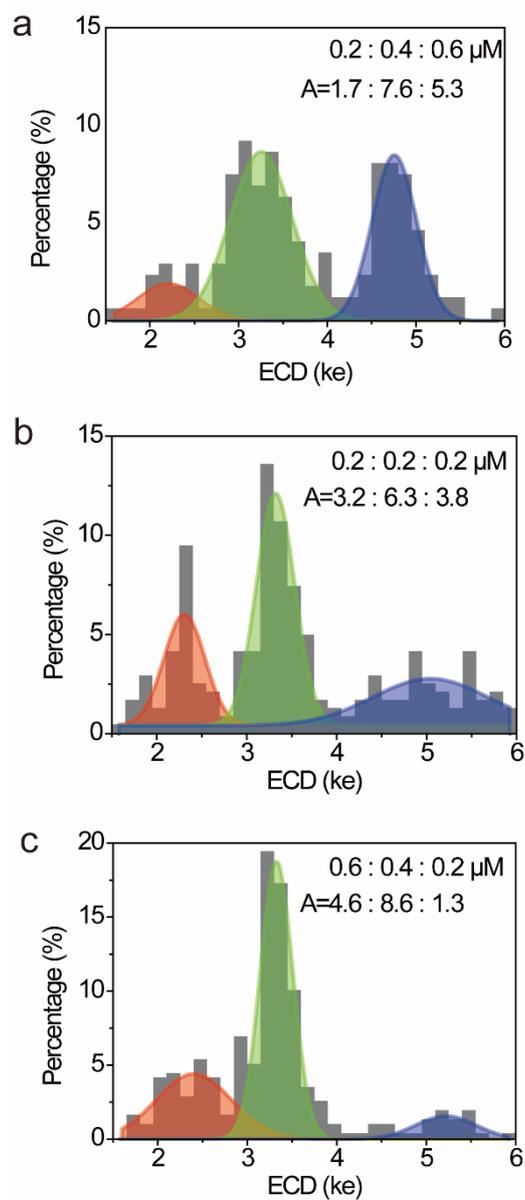

2

3 **Figure S13.** Fluorescence intensity sum in Figure 4b of different molecular weight dextrans (1  $\mu$ M,  
4 without dextran, dextran 20, 40, and 70) mixed with 3% PEI<sub>1800</sub>-oBA and 30  $\mu$ M TPE-COOH under  
5 300 mV voltage for 30 min (1 M LiCl, 10 mM Tris-HCl, pH 7.4).

6

## 1 16. ECD histogram for dextran mixtures

2  
3 **Figure S14.** ECD histogram for dextran mixtures (dextran 20: dextran 40: dextran 70) with  
4 respective concentration ratios of (a) 0.2: 0.4: 0.6  $\mu\text{M}$ , (b) 0.2: 0.2: 0.2  $\mu\text{M}$ , and (c) 0.6: 0.4: 0.2  $\mu\text{M}$   
5 mixed with 3% PEI<sub>1800</sub>-oBA at 300 mV voltage (1 M LiCl, 10 mM Tris-HCl, pH 7.4).
