## I. General information:

${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Varian Inova ( 500 MHz ) spectrometer, and chemical shifts were reported in ppm relative to tetramethylsilane (TMS). Data for ${ }^{1} \mathrm{H}$ NMR are reported as follows: chemical shift ( $\delta \mathrm{ppm}$ ), multiplicity ( $\mathrm{s}=$ singlet; $\mathrm{d}=$ doublet; dd = doublet of doublets; ddd $=$ doublet of doublet of doublets; $\mathrm{m}=$ multiplet), coupling constant $(\mathrm{Hz})$, and integration. Data for ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Varian Inova ( 125 MHz ) spectrometer, chemical shifts are reported in ppm relative to the solvent $\left(\mathrm{CDCl}_{3}\right.$ as $\left.\mathrm{d}=77.2 \mathrm{ppm}\right)$. High-resolution mass spectra (HRMS) were obtained using a Waters Q-TOF Ultima ESI (electrospray ionization) and are reported in $\mathrm{m} / \mathrm{z}$. Silica gel high-purity, pore size 60 , particle size $40-63 \mu \mathrm{~m}, 230-400$ mesh was used for flash column chromatography. Rotary evaporation was performed using a Buchi R-300 rotary evaporator and Welch Model 2027 dry vacuum pump. Carbonyl reagents and catalysts 3, 4, 5, $\mathbf{F}_{2}$ Irpic, and $\mathbf{S} 2$ were purchased from commercial sources and used without further purification. Thiourea $\mathbf{2}$ was prepared according to literature. ${ }^{1}$

## II. General procedures for the photoacid catalyzed acetalization of carbonyls:

## Procedure A:

To an 8 mL vial fitted with a magnetic stir bar was added 6-bromo-2-naphthol ( $0.011 \mathrm{~g}, 0.05 \mathrm{mmol}, 0.1$ equiv.) and the corresponding alcohol ( 1 mL ). Next, the carbonyl compound was added ( $0.5 \mathrm{mmol}, 1.0$ equiv.) The reaction mixture was then sparged for 5 min , sealed, and placed 4.0 cm from a 40 W Blue LED light (Kessil Tuna Blue) for 18 h . Cooling fans were used to maintain room temperature. To the reaction was then added 5,6 -dibromo-1,2-benzodioxole ( 0.5 mmol ) and $250 \mu \mathrm{~L}$ of dioxane (to solubilize the std.). An aliquot was then taken up, dissolved in $\mathrm{CDCl}_{3}$, and analyzed by ${ }^{1} \mathrm{H}$ NMR.

## Column free acetal isolation and catalyst recovery:

Procedure B:

## Acetal isolation:

The reaction mixture was transferred into a separatory funnel using 5 mL of diethyl ether. Saturated aqueous sodium bisulfite ( 10 mL ) was added, and the mixture was shaken vigorously for approximately 1 min (Figure S1, A). The organic layer was washed with 3 X 10 mL 1 M NaOH , dried over $\mathrm{MgSO}_{4}$, filtered, and concentrated in vacuo to give the acetal (Figure S1, B).

## Recovery of catalyst 3:

Concentrated HCl was added to $\mathrm{NaOH}(\mathrm{aq})$ layer (from Figure S1, B) until pH 7 (Figure S1, C). Afterward, 2 X 10 mL of diethyl ether was added. Then the organic layer was collected and dried over MgSO 4 , filtered, and concentrated in vacuo to give $\mathbf{3}$ as a white solid in up to $96 \%$ yield. Note: If needed $\mathbf{3}$ can be run through a $\mathrm{SiO}_{2}$ plug with hexanes/ethyl acetate to remove trace impurities.

[^0]

up to $96 \%$ recovery

Figure S1: Column free isolation of acetals and recovery of catalyst $\mathbf{3}$.

## III. Additional catalyst, substrate, and control reactions:

Iridium catalyst S1 gives no product (Scheme S1). Ruthenium catalyst S2 gives 7 in $94 \%$ yield and dibromoBINOL S3 gives $\mathbf{7}$ in $\mathbf{7 6 \%}$ yield. Note: S1 gives up to $40 \%$ yield of acetal $\mathbf{1 3}$ via triplet energy transfer with 5 (vide infra).

Scheme S1: Reactions run according to modified procedure A.
In general, sterically hindered and more complicated alcohol substrates did not work well using photocatalyst 3. (Scheme S2).

Scheme S2: Unsuccessful substrates run according to procedure A.

In the case of benzaldehyde (6) aerobic (reaction run open to air) photoirradiation in the absence of a catalyst provides 7 in $90 \%$ efficiency (Scheme S3, A). This phenomenon is only observed for benzaldehyde with methanol, when ethanol is used compound $\mathbf{S 4}$ is not observed. Additionally, acetals $\mathbf{1 4}$ and $\mathbf{1 8}$ are not formed in the absence of catalyst with methanol. Also, acetal 14 was formed in $90 \%$ yield with $10 \mathrm{~mol} \% \mathbf{3}$ left open to air, suggesting that the triplet excited state of $\mathbf{3}$ may not be important for the rection to proceed (Scheme S3, B). Note that purification of benzaldehyde by washing with $\mathrm{NaOH}_{(a q)}$, Sat. $\mathrm{Na}_{2} \mathrm{SO}_{3}$, drying over $\mathrm{MgSO}_{4}$, and freshly distilling had no effect on reaction efficiency with $10 \mathrm{~mol} \% \mathbf{3}$ under argon or without catalyst open to air, 7 was formed in $80-90 \%$ efficiency. ${ }^{2}$

[^1]

Scheme S3: Reactions run according to modified procedure A, no sparge, and left open to air. ${ }^{\text {a }}$ Run with 390 nm LEDs. ${ }^{\text {b }}$ Run with 370 nm LEDs.

It is possible that benzoic acid is being generated under the reaction conditions, however, when $10 \mathrm{~mol} \%$ benzoic acid was used with and without light only 40 and $50 \%$ yield was observed, respectively (Table S1, Entries 1 and 2). The addition of $5 \mathrm{~mol} \%$ triethylamine (TEA) shut down the standard reaction (with 10 $\mathrm{mol} \% \mathrm{3}$ ), however 4-chlorobenzaldehyde proceeds in $68 \%$ yield with $5 \mathrm{~mol} \%$ TEA in the absence of a catalyst (Entries 3 and 4). The addition of $15 \mathrm{~mol} \%$ triethylamine shut down the reaction with 4 chlorobenzaldehyde in the absence of $\mathbf{3}$, suggesting that the mechanism is indeed acid-catalyzed (Entry 5). Finally, the addition of $5 \mathrm{~mol} \%$ sodium bicarbonate shut down the standard reaction and the reaction with 4-chlorobenzaldehyde (Entries 6 and 7).

|  |  |  | $\frac{\text { Cat. }(10 \mathrm{~mol} \%) \text {, additive }}{\text { light, } \mathrm{rt}, 18 \mathrm{~h}}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Entry | x | Cat. | additive | light | \%yield |
| 1 | H | - | $10 \mathrm{~mol} \%$ benzoic acid | Blue LEDs | 40 |
| 2 | H | - | $10 \mathrm{~mol} \%$ benzoic acid | - | 50 |
| 3 | H | 3 | $5 \mathrm{~mol} \% \mathrm{NEt}_{3}$ | Blue LEDs | 0 |
| 4 | Cl | - | $5 \mathrm{~mol} \% \mathrm{NEt}_{3}$ | Blue LEDs | 68 |
| 5 | Cl | - | $15 \mathrm{~mol} / \mathrm{NEt}_{3}$ | Blue LEDs | 0 |
| 6 | H | 3 | $5 \mathrm{~mol} \% \mathrm{NaHCO}_{3}$ | Blue LEDs | 0 |
| 7 | Cl | - | $5 \mathrm{~mol} \% \mathrm{NaHCO}_{3}$ | Blue LEDs | 0 |

Table S1: Reactions run with 0.5 mmol aldehyde in $\mathrm{MeOH}(0.5 \mathrm{M})$, under argon atmosphere, \% yields based on ${ }^{1} \mathrm{H}$ NMR using an internal standard: 5,6-dibromo-1,3-benzodioxole.

To better understand the catalyst free formation of halogen containing acetals we purified 4bromobenzaldehyde via recrystallization. Regardless of whether the reaction contained catalyst or was open to air, product was formed in $90-92 \%$ yield (Entries $1-4$, Table S2).

Table S2: Reactions run with 0.5 mmol 4-bromobenzaldehyde (freshly recrystallized) in $\mathrm{MeOH}(0.5 \mathrm{M})$, \% yields based on ${ }^{1} \mathrm{H}$ NMR using an internal standard: 5,6-dibromo-1,3-benzodioxole.

It is worth noting that we observed inconsistent results depending on the batch of methanol used (Table S3). Several "dry" bottles of AcroSeal ${ }^{\circledR}$ methanol were shipped from the vendor leaking, and thus were assumed not to be dry, and provided no product (Entries 1 and 2). Others appeared to be sealed, however, no reaction was observed, even after subsequent drying with $5 \AA$ mol sieves (Entries 3 and 4). Ultimately, it was determined that methanol dried over activated $5 \AA \mathrm{MS}$ and subsequent bulb-to-bulb distillation under argon via a short path condenser provided consistent results, Entry 7.

| Entry | MeOH Source | Part - Lot \# | \% yield | Comments |
| :---: | :--- | :--- | :---: | :--- |
| 1 | AcroSeal $^{\circledR}$ | $36439-$ B0539396A | 0 | Shipped from vendor leaking |
| 2 | AcroSeal $^{\circledR}$ | $36439-\mathrm{B} 0538002 \mathrm{~A}^{\mathrm{b}}$ | 0 | Shipped from vendor leaking |

| 6 | Macron | $3016-16-0000178672$ | 13 | Dried over 5 $\AA$ mol sieves |
| 7 | Macron | $3016-16-0000178672$ | 90 | Distilled over $5 \AA$ mol sieves |

Table S3: ${ }^{\text {a }}$ Conditions: Carbonyl compound $(0.5 \mathrm{mmol})$ in the corresponding alcohol $(0.5 \mathrm{M})$, under argon atmosphere, $\%$ yields based on ${ }^{1} \mathrm{H}$ NMR using an internal standard: 5,6-dibromo-1,3-benzodioxole. ${ }^{\mathrm{b}}$ LOT \#s: B0539396A and B0538002A shipped over mol sieves from vendor.

## IV. Compound characterization:

All compounds are consistent with the reported literature. ${ }^{3,4,5,6,7,8,9,10,11,12}$

(dimethoxymethyl)benzene 7: Compound 7 was prepared according to the general procedure $\mathbf{A}$ and purified according to procedure B to give a pale-yellow oil, $0.067 \mathrm{~g}, 83 \%$ yield. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.48$ - $7.42(\mathrm{~m}, 2 \mathrm{H}), 7.39-7.29(\mathrm{~m}, 3 \mathrm{H}), 5.39(\mathrm{~s}, 1 \mathrm{H}), 3.33(\mathrm{~s}, 6 \mathrm{H})$.

4-(dimethoxymethyl)benzonitrile $\mathbf{8}$ : Compound $\mathbf{8}$ was prepared according to the general procedure $\mathbf{A}, 86 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. give $8^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.67(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.58(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 5.43(\mathrm{~s}, 1 \mathrm{H}), 3.33$ (s, 6H). ${ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 143.31, 132.22, 127.71, 118.84, 112.43, 101.85, 52.83.

1-(4-(dimethoxymethyl)phenyl)ethan-1-one 9: Compound 9 was prepared according to modified general procedure A, using 0.25 mmol aldehyde, $20 \mathrm{~mol} \% 3,0.33 \mathrm{M} \mathrm{MeOH}$ :dioxane ( $2: 1$ ), to give $44 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.97(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.56(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 2 \mathrm{H}), 5.45(\mathrm{~s}, 1 \mathrm{H}), 3.34(\mathrm{~s}, 6 \mathrm{H})$, 2.62 ( $\mathrm{s}, 3 \mathrm{H}$ ).

[^2]

1-(dimethoxymethyl)-4-fluorobenzene 10: Compound 10 was prepared according to the general procedure A, $76 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.45-7.38(\mathrm{~m}, 2 \mathrm{H}), 7.05(\mathrm{t}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 5.37(\mathrm{~s}, 1 \mathrm{H}), 3.32(\mathrm{~s}$, $6 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 162.91\left(\mathrm{~d}, J_{F C}=246.3 \mathrm{~Hz}\right), 134.11\left(\mathrm{~d}, J_{F C C C C}=3.2 \mathrm{~Hz}\right), 128.63(\mathrm{~d}$, $\left.J_{F C C C}=8.2 \mathrm{~Hz}\right), 115.21\left(\mathrm{~d}, J_{F C C}=21.2 \mathrm{~Hz}\right), 102.63,52.76$.

1-chloro-4-(dimethoxymethyl)benzene 11: Compound 11 was prepared according to the general procedure A and purified according to procedure $\mathbf{B}$ to give a pale-yellow oil, $0.060 \mathrm{~g}, 64 \%$ yield. ${ }^{1} \mathrm{H} \mathrm{NMR}(500 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 7.38(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.33(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 5.37(\mathrm{~s}, 1 \mathrm{H}), 3.30(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 125 MHz , $\mathrm{CDCl}_{3}$ ) $\delta 136.73,134.32,128.45,128.26,102.34,52.60$. HRMS (ESI) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{H}]$ calcd for $\mathrm{C}_{9} \mathrm{H}_{12} \mathrm{ClO}_{2}$, 186.0451 found 186.0448 .

1-bromo-4-(dimethoxymethyl)benzene 12: Compound 12 was prepared according to the general procedure A, $90 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.49(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.32(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 5.35(\mathrm{~s}, 1 \mathrm{H}), 3.30$ $(\mathrm{s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 137.25,131.45,128.63,122.61,102.40,52.67$. HRMS (ESI) m/z $[\mathrm{M}+\mathrm{H}]$ calcd for $\mathrm{C}_{9} \mathrm{H}_{11} \mathrm{BrO}_{2}$, 229.9942; found 229.9932.

1-(dimethoxymethyl)-4-(trifluoromethyl)benzene 13: Compound 13 was prepared according to the general procedure $\mathbf{A}, 94 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6 -dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.63(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.58(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 5.44$ $(\mathrm{s}, 1 \mathrm{H}), 3.33(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(125 \mathrm{MHz}, \mathrm{CDCl3}_{3}\right) \delta 142.14,130.73\left(\mathrm{q}, J_{F C C}=32.3 \mathrm{~Hz}\right), 127.30,125.26$ $\left(\mathrm{q}, J_{F C C C}=3.5 \mathrm{~Hz}\right), 124.29\left(\mathrm{q}, J_{\mathrm{FC}}=272.0 \mathrm{~Hz}, \mathrm{CF}_{3}\right), 102.27,52.70$.

1-(dimethoxymethyl)-4-methylbenzene 14: Compound 14 was prepared according to the general procedure $\mathbf{A}$ and purified according to procedure $\mathbf{B}$ to give a pale-yellow oil, $0.065 \mathrm{~g}, 74 \%$ yield. ${ }^{1} \mathrm{H} \mathrm{NMR}(500 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 7.33(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.17(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 5.36(\mathrm{~s}, 1 \mathrm{H}), 3.32(\mathrm{~s}, 6 \mathrm{H}), 2.35(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 138.27,135.25,128.99,126.72,103.33,52.75,21.32 . \operatorname{HRMS}(\mathrm{ESI}) \mathrm{m} / \mathrm{z}[\mathrm{M}+$ H] calcd for $\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{O}_{2}, 166.0994$ found 166.0994 .

1-(dimethoxymethyl)-4-isopropylbenzene 15: Compound 15 was prepared according to the general procedure $\mathbf{A}, 77 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.36(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 7.22(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 5.35$ $(\mathrm{s}, 1 \mathrm{H}), 3.33(\mathrm{~s}, 6 \mathrm{H}), 3.00-2.80(\mathrm{~m}, 1 \mathrm{H}), 1.25(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 149.31$, $135.65,126.76,126.40,103.53,52.95,34.03,24.11$. HRMS (ESI) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{H}]$ calcd for $\mathrm{C}_{12} \mathrm{H}_{19} \mathrm{O}_{2}$, 194.1307 found 194.1303 .

1-(tert-butyl)-4-(dimethoxymethyl)benzene 16: Compound 16 was prepared according to the general procedure $\mathbf{A}, 75 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.44-7.32(\mathrm{~m}, 4 \mathrm{H}), 5.36(\mathrm{~s}, 1 \mathrm{H}), 3.33(\mathrm{~s}, 6 \mathrm{H}), 1.32(\mathrm{~s}$, $9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (125 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 151.54,135.25,126.47,125.25,103.52,52.97,34.72,31.47$.

1-(dimethoxymethyl)-4-methoxybenzene 17: Compound 17 was prepared according to the general procedure $\mathbf{A}, 56 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.37(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 6.89(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 5.35$ $(\mathrm{s}, 1 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 3.31(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 159.79,130.49,128.04,113.65,103.18$, 55.37, 52.72. HRMS (ESI) m/z [M + H] calcd for $\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{O}_{3}, 182.0943$ found 182.0948 .

1-(dimethoxymethyl)-4-ethynylbenzene 18: Compound 18 was prepared according to modified general procedure A, using $20 \mathrm{~mol} \% \mathbf{3}, 370 \mathrm{~nm}$ LEDs, $0.33 \mathrm{M} \mathrm{MeOH:dioxane} \mathrm{(2:1)} \mathrm{to} \mathrm{give} 78 \$,$% yield as$ determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6 -dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.50(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 2 \mathrm{H}), 7.41(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 2 \mathrm{H}), 5.39(\mathrm{~s}, 1 \mathrm{H}), 3.32(\mathrm{~s}, 6 \mathrm{H}), 3.08(\mathrm{~s}$, $1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 138.87,132.14,126.87,122.31,102.61,83.56,77.59,52.75$. HRMS (ESI) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{H}]$ calcd for $\mathrm{C}_{11} \mathrm{H}_{13} \mathrm{O}_{2}, 176.0837$ found 176.0835.

1-(dimethoxymethyl)-3-nitrobenzene 19: Compound 19 was prepared according to the general procedure A, $72 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.35(\mathrm{~s}, 1 \mathrm{H}), 8.22-8.16(\mathrm{~m}, 1 \mathrm{H}), 7.80(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.56(\mathrm{t}$, $J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.48(\mathrm{~s}, 1 \mathrm{H}), 3.35(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 148.32,140.40,132.91,129.26$, 123.44, 122.07, 101.44, 52.72. HRMS (ESI) m/z [M + H] calcd for $\mathrm{C}_{9} \mathrm{H}_{12} \mathrm{NO}_{4}, 197.0688$ found 197.0691.

1-(dimethoxymethyl)-2-methylbenzene 20: Compound $\mathbf{2 0}$ was prepared according to the general procedure A, $50 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.53(\mathrm{~d}, J=6.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.31-7.10(\mathrm{~m}, 3 \mathrm{H}), 5.46(\mathrm{~s}, 1 \mathrm{H}), 3.32(\mathrm{~s}$, 6 H ), $2.37(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 136.39$, 135.77, 130.66, 128.51, 126.65, 125.56, 101.89, 53.16, 19.02 .

(E)-(3,3-dimethoxyprop-1-en-1-yl)benzene 21: Compound 21 was prepared according to the general procedure A to give $72 \%$ yield as a $91: 9$ mixture of $E: Z$ isomers as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard, and purified by column chromatography ( $98 \%$ hexanes $/ 2 \%$ triethylamine) to give a $70: 30$ mixture of $E: Z$ isomers, the isolated yield was not determined. Peaks corresponding to the $E$-isomer are as follows: ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.46-7.23(\mathrm{~m}, 5 \mathrm{H})$, $6.73(\mathrm{~d}, J=15.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.16(\mathrm{dd}, J=16.3,4.7 \mathrm{~Hz}, 2 \mathrm{H}), 4.96(\mathrm{~d}, J=4.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.38(\mathrm{~s}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 136.23,133.73,128.73,128.25,126.87,125.83,103.06,52.87$. Peaks corresponding to the $Z$-isomer are as follows: ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 5.76(\mathrm{dd}, J=11.9,7.4 \mathrm{~Hz}, 1 \mathrm{H}), 5.11(\mathrm{~d}, J=$ $7.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.36(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 99.66, 52.42.

2-(dimethoxymethyl)furan 22: Compound 22 was prepared according to modified general procedure $\mathbf{A}$, using $20 \mathrm{~mol} \% \mathbf{3}, 370 \mathrm{~nm}$ LEDs, $0.33 \mathrm{M} \mathrm{MeOH:dioxane} \mathrm{(2:1)} \mathrm{to} \mathrm{give} 64 \$,$% yield as determined by { }^{\mathrm{H}} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1}$ H NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 7.44-7.37(\mathrm{~m}, 1 \mathrm{H}), 7.29-7.24(\mathrm{~m}, 1 \mathrm{H}), 6.44-6.41(\mathrm{~m}, 1 \mathrm{H}), 6.39-6.35(\mathrm{~m}, 1 \mathrm{H}), 5.44(\mathrm{~s}, 1 \mathrm{H})$, $3.36(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 150.99,142.64,110.20,108.58,98.10,52.99$.

2-(dimethoxymethyl)thiophene 23: Compound 23 was prepared according to modified general procedure A, using $20 \mathrm{~mol} \% \mathbf{3}, 370 \mathrm{~nm}$ LEDs, 0.33 M MeOH :dioxane ( $2: 1$ ), to give $92 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 7.29(\mathrm{~d}, J=5.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.07(\mathrm{dd}, J=2.8,1.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.00(\mathrm{dd}, J=5.0,3.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.64(\mathrm{~s}$, $1 \mathrm{H}), 3.36(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 141.61,126.76,125.78,125.52,100.18,52.64$. HRMS (ESI) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{H}]$ calcd for $\mathrm{C}_{7} \mathrm{H}_{11} \mathrm{O}_{2} \mathrm{~S}, 159.0474$ found 159.0475 .

(3,3-dimethoxypropyl)benzene 24: Compound 24 was prepared according to modified general procedure A, using $20 \mathrm{~mol} \% 3$, to give $62 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6 -dibromo-1,3benzodioxole as an internal standard. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.37-7.09(\mathrm{~m}, 5 \mathrm{H}), 4.37(\mathrm{t}, 1 \mathrm{H}), 3.33$ $(\mathrm{s}, 6 \mathrm{H}), 2.68(\mathrm{t}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 1.97-1.89(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 141.77,128.74$, 128.54, 126.02, 103.90, 52.87, 34.23, 31.01. HRMS (ESI) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{H}]$ calcd for $\mathrm{C}_{11} \mathrm{H}_{17} \mathrm{O}_{2}, 181.1229$ found 181.1184

1,1-dimethoxycyclohexane 25: Compound 25 was prepared according to the general procedure $\mathbf{A}, 75 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 3.17(\mathrm{~s}, 6 \mathrm{H}), 1.91-1.30(\mathrm{~m}, 11 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 100.09$, $47.43,32.81,25.72,22.95$. HRMS (ESI) m/z [M + H] calcd for $\mathrm{C}_{8} \mathrm{H}_{17} \mathrm{O}_{2}, 145.1229$ found 145.1184 .

1-(diethoxymethyl)-4-(trifluoromethyl)benzene 26: Compound 26 was prepared according to modified general procedure $\mathbf{A}$ using $20 \mathrm{~mol} \% \mathbf{3}$ and purified according to procedure $\mathbf{B}$ to give a pale-yellow oil, $0.079 \mathrm{~g}, 64 \%$ yield. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.67-7.58(\mathrm{~m}, 4 \mathrm{H}), 5.57(\mathrm{~s}, 1 \mathrm{H}), 3.69-3.48(\mathrm{~m}, 4 \mathrm{H})$, $1.33-1.18(\mathrm{~m}, 6 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 143.17,130.58\left(\mathrm{q}, J_{F C C}=32.2 \mathrm{~Hz}\right), 127.23,125.26(\mathrm{q}$, $\left.J_{\mathrm{FCCC}}=3.8 \mathrm{~Hz}\right), 124.29\left(\mathrm{q}, J_{\mathrm{FC}}=272.0 \mathrm{~Hz}, \mathrm{CF}_{3}\right), 100.78,61.28,15.23$.

1-(diethoxymethyl)-3-nitrobenzene 27: Compound 27 was prepared according to modified general procedure A using $20 \mathrm{~mol} \% \mathbf{3}$, to give $70 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.40-8.31(\mathrm{~m}, 1 \mathrm{H}), 8.19$ $(\mathrm{d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.82(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.58-7.52(\mathrm{~m}, 1 \mathrm{H}), 5.59(\mathrm{~s}, 1 \mathrm{H}), 3.70-3.48(\mathrm{~m}, 4 \mathrm{H}), 1.27$ $(\mathrm{s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 148.41,141.53,133.00,129.33,123.42,122.09,100.14,61.41$, 15.27.

2-(4-(trifluoromethyl)phenyl)-1,3-dioxolane 28: Compound 28 was prepared according to modified general procedure $\mathbf{A}$ using $20 \mathrm{~mol} \% \mathbf{3}, 62 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.65(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H})$, $7.60(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 5.86(\mathrm{~s}, 1 \mathrm{H}), 4.16-4.01(\mathrm{~m}, 4 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 142.05,131.36$ $\left(\mathrm{q}, J_{\mathrm{FCC}}=32.2 \mathrm{~Hz}\right), 125.47\left(\mathrm{q}, J_{F C C C}=3.8 \mathrm{~Hz}\right), 124.16\left(\mathrm{q}, J_{C F}=272.3 \mathrm{~Hz}, \mathrm{CF}_{3}\right), 126.96,102.90,65.52$.

4,4,5,5-tetramethyl-2-phenyl-1,3-dioxolane 29: Compound 29 was prepared was prepared according to modified general procedure $\mathbf{A}$, using $20 \mathrm{~mol} \% 3$ and 0.33 M MeOH :dioxane ( $2: 1$ ). Compound 29 was purified according to procedure B to give a pale-yellow oil, $0.069 \mathrm{~g}, 67 \%$ yield. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $\delta 7.49(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.38-7.27(\mathrm{~m}, 3 \mathrm{H}), 5.98(\mathrm{~s}, 1 \mathrm{H}), 1.32(\mathrm{~s}, 6 \mathrm{H}), 1.27(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (125 $\mathrm{MHz}) \delta 139.76,128.70,128.34,126.36,100.00,82.73,24.43,22.29$.

(3,3-bis(2-chloroethoxy)propyl)benzene 30: Compound 30 was prepared according to the general procedure $\mathbf{A}, 53 \%$ yield as determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 5,6-dibromo-1,3-benzodioxole as an internal standard. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.32-7.26(\mathrm{~m}, 2 \mathrm{H}), 7.22-7.16(\mathrm{~m}, 3 \mathrm{H}), 4.63(\mathrm{t}, J=$ $5.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.86(\mathrm{dt}, J=11.0,5.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.75(\mathrm{dt}, J=11.0,5.7 \mathrm{~Hz}, 2 \mathrm{H}), 3.65(\mathrm{t}, J=5.6 \mathrm{~Hz}, 4 \mathrm{H}), 2.75-$ $2.69(\mathrm{~m}, 2 \mathrm{H}), 2.03-1.95(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 141.28,128.54,128.51,126.11$, 102.47, 65.44, 43.41, 34.55, 30.93.

## V. Photosensitizer procedure and mechanistic studies:

## General procedure for sensitizer reaction:

To an 8 mL vial fitted with a magnetic stir bar was added $\mathbf{F}_{2} \mathbf{I r p i c}$ \{bis[2-(4,6-difluorophenyl)pyridinato$\mathrm{C} 2, \mathrm{~N}]$ (picolinato)iridium(III) $\}(0.005 \mathrm{~g}, 0.0065 \mathrm{mmol}, 0.025$ equiv.), 2-naphthol ( $0.018 \mathrm{~g}, 0.125 \mathrm{mmol}, 0.5$ equiv.), and methanol ( 1 mL ). Next, the carbonyl compound was added ( $0.25 \mathrm{mmol}, 1.0$ equiv.). The reaction mixture was then sparged for 5 min , sealed, and placed 4.0 cm from a 40 W Blue LED light (Kessil Tuna Blue) for 18 h . Cooling fans were used to maintain room temperature. To the reaction was then added 5,6-dibromo-1,2-benzodioxole ( 0.5 smmol ) and $250 \mu \mathrm{~L}$ of dioxane. An aliquot was then taken up, dissolved in $\mathrm{CDCl}_{3}$, and analyzed by ${ }^{1} \mathrm{H}$ NMR.

## Photosensitizer mechanistic studies:

Emission quenching studies showed that $\mathbf{F}_{2}$ Irpic emission was $34 \%$ quenched in the presence of 2-naphthol (5) with and without benzaldehyde (6) and 4-trifluoromethyl benzaldehyde (S5), suggesting efficient energy transfer between $\mathbf{F}_{2}$ Irpic and $\mathbf{5}$ (Figure S 2 ). No $\mathbf{F}_{2}$ Irpic emission quenching was observed in the presence of 6 and $\mathbf{S 5}$ in the absence of 5 .

Figure S2: Emission spectra of $\mathbf{F}_{2} \mathbf{I r p i c}$ [bis(4,6-difluorophenyl-pyridine)(picolinate) iridium(III)] (0.8 mM in methanol) with and without 25 equivalents of the corresponding aldehydes ( $\mathbf{6}$ or $\mathbf{S 5}$ ) and/or 2naphthol (5) [Excitation wavelength: 454 nm ].

Emission quenching studies showed that $\mathbf{S 1}$ emission was $80 \%$ quenched in the presence of 2-naphthol (5) with and without 4-trifluoromethyl benzaldehyde (S5) (Figure S3). No S1 emission quenching was observed in the presence of $\mathbf{S 5}$ in the absence of 5 .

Figure S3: Emission spectra of $\left[\operatorname{Ir}\left\{\mathrm{dF}\left(\mathrm{CF}_{3}\right)\right.\right.$ ppy $\left.\left.\} 2(\mathrm{dtbpy})\right] \mathrm{PF}_{6}\right](\mathbf{S 1})[0.8 \mathrm{mM}$ in methanol] with and without 25 equivalents of the corresponding aldehyde (S5) and/or 2-naphthol (5) [Excitation wavelength: $454 \mathrm{~nm}]$.

Emission quenching studies showed that the emission of ruthenium complex $\mathbf{S} 2$ was not quenched by either aldehyde $\mathbf{S 5}$ or 2-naphthol (5) [Figure S4].

Figure S4: Emission spectra of $\mathbf{S} 2\left[\mathrm{Ru}(\mathrm{bby})_{3}\left(\mathrm{PF}_{6}\right)_{2}\right],\{0.8 \mathrm{mM}$ in methanol $\}$ with and without 25 equivalents of the aldehyde $\mathbf{S 5}$ and/or 2-naphthol (5) [Excitation wavelength: 450 nm ].

A possible mechanism for the formation of $\mathbf{1 3}$ is shown in Scheme S4. Photoexcitation of $\mathbf{F}_{2} \mathbf{I} \mathbf{r p i c}$ results in formation of singlet ${ }^{1} \mathbf{F}_{2}$ Irpic ${ }^{*}$, intersystem crossing (ISC), and metal to ligand charge transfer (MLCT) gives rise to triplet excited state ${ }^{3} \mathbf{F}_{2}$ Irpic ${ }^{*}$. Triplet energy transfer (TET) from ${ }^{3} \mathbf{F}_{2}$ Irpic ${ }^{*}$ to $\mathbf{5}$, gives rise to $\mathbf{5}^{*}$ which is sufficiently acidic to protonate aldehyde $\mathbf{S 5}$ to afford oxonium $\mathbf{S 6}$. Subsequent reaction of S6 or hydrogen bonding complex $\mathbf{S 6}^{*}$ with 2 equivalents of methanol results in formation of acetal product $\mathbf{1 3}$ and regenerates a proton. The resulting in situ generated proton can either protonate an additional equivalent of aldehyde or protonate $\mathbf{S 7}$ to reconstitute $\mathbf{5}$. The addition of $5 \mathrm{~mol} \%$ sodium bicarbonate shut down acetal formation in the presence of $\mathbf{F}_{2}$ Irpic with and without $\mathbf{5}$, suggesting that the reaction involves generation of a Brønsted acid. Notably, unlike in the case of 6-bromo-2-naphthol (3), overnight irradiation of $\mathbf{F}_{\mathbf{2}}$ Irpic and $\mathbf{5}$, followed by the addition of $\mathbf{S 5}$ and placement in the dark resulted in no product formation. There does not appear to be generation of a persistent in situ generated acidic species (vide infra). The reaction is completely shut down if left open to air with $\mathbf{F}_{\mathbf{2}} \mathbf{I r p i c}$ with and without 5. It is also worth noting that the use of 1 equiv. of $\mathbf{5}$ does not provided and increase in reaction efficiency.

Scheme S4: Potential mechanism for triplet energy transfer and photoactivation of naphthol. Run according to the general procedure for sensitizer reactions: $(0.5 \mathrm{mmol})$ aldehyde in methanol $(0.5 \mathrm{M})$, under argon atmosphere, $\%$ yields based on ${ }^{1} \mathrm{H}$ NMR using an internal standard: 5,6-dibromo-1,3-benzodioxole.

When iridium photocatalyst S1 in combination with $\mathbf{5}$ is used, $\mathbf{4 0 \%}$ yield of $\mathbf{1 3}$ is obtained in (Scheme S5). No product is observed with $\mathbf{S 1}$ in the absence of $\mathbf{5}$.

Scheme S5: Run according to the general procedure for sensitizer reactions: ( 0.5 mmol ) aldehyde in methanol ( 0.5 M ), under argon atmosphere, \% yields based on ${ }^{1} \mathrm{H}$ NMR using an internal standard: 5,6-dibromo-1,3-benzodioxole.

With iridium photocatalyst $\mathbf{S 2},>90 \%$ yield of $\mathbf{1 3}$ is observed with and without 2-naphthol 5. This suggests that a different mechanism may be operable (Scheme S6). Notably, the addition of $5 \mathrm{~mol} \% \mathrm{NaHCO}_{3}$ shuts down the reaction with $\mathbf{S 2}$ and with $(\mathbf{S 2}+\mathbf{5})$, suggesting that in both cases there is photogeneration of a Brønsted acidic species.

Scheme S6: Run according to the general procedure for sensitizer reactions: ( 0.5 mmol ) aldehyde in methanol ( 0.5 M ), under argon atmosphere, \% yields based on ${ }^{1} \mathrm{H}$ NMR using an internal standard: 5,6-dibromo-1,3-benzodioxole.

It was observed that electron-withdrawing groups are required for the sensitization reaction to proceed. When benzaldehyde (6) was investigated only $6 \%$ product 7 was observed in the presence of $\mathbf{F}_{2}$ Irpic, with and without 5 (Scheme S7). For the reaction of electron-rich $p$-tolualdehyde (S8) in the presence of $\mathbf{F}_{2} \mathbf{I r p i c}$, with or without 5,57 and 54\% yield of $\mathbf{1 2}$ was observed, respectively (Scheme S8).

Scheme S7: Photosensitizer and 2-naphthol with benzaldehyde. Run according to the general procedure for sensitizer reactions: $(0.5 \mathrm{mmol})$ aldehyde in methanol $(0.5 \mathrm{M})$, under argon atmosphere, $\%$ yields based on ${ }^{1} \mathrm{H}$ NMR using an internal standard: 5,6-dibromo-1,3-benzodioxole.

Scheme S8: Photosensitizer and 2-naphthol with $p$-tolualdehyde. Run according to the general procedure for sensitizer reactions: ( 0.5 mmol ) aldehyde in methanol $(0.5 \mathrm{M})$, under argon atmosphere, $\%$ yields based on ${ }^{1} \mathrm{H}$ NMR using an internal standard: 5,6-dibromo-1,3-benzodioxole.

## IV. Initiation kinetics and NMR evidence for photogenerated strong acid:

The standard reaction was monitored under constant irradiation with Blue LEDs (Figure S5). A 2 h induction period was observed, after which the reaction reached $90 \%$ conversion after 6 h .

Figure S5: Reaction run according to standard procedure A. Aliquots were taken every 1 h using a BD spinal needle and \%conversion of $\mathbf{6}$ to 7 was determined by NMR spectroscopy.

To further probe the initiation kinetics, catalyst $\mathbf{3}$ in methanol was irradiated with Blue LEDs for 17 h (Figure S6). Next, aldehyde $\mathbf{6}$ was added and the reaction was placed in the dark. The reaction reached completion in less than 2 h . This suggests that a strongly acidic species is generated and persists in the absence of further irradiation.

Figure S6: Reaction run with 0.05 mmol 3 and 0.5 mmol 6 in methanol ( 0.5 M ) under argon atmosphere. Aliquots were taken using a BD spinal needle and \%conversion of 6 to 7 was determined by NMR spectroscopy.

To test the reversibility of strong acid formation, catalyst $\mathbf{3}$ was irradiated in methanol for 24 h (Figure S7). The reaction was then placed in the dark for 26 h . Next, $\mathbf{6}$ was added, and the reaction was left to stir in the dark until complete. Despite having stirred in the dark for 26 h , the reaction still finished in less than 2 h , indicating the formation of a persistent strongly acidic species is not reversible.

Figure S7: Reaction run with 0.05 mmol 3 and 0.5 mmol 6 in methanol ( 0.5 M ) under argon atmosphere. Aliquots were taken using a BD spinal needle and \%conversion of $\mathbf{6}$ to 7 was determined by NMR spectroscopy.

The hydroxyl peak of catalyst $\mathbf{3}$ in the absence of aldehyde $\mathbf{6}$ is shown in Figure S8, A. Upon the addition of 6 the OH-peak broadens slightly and shifts downfield from 5.17 ppm to 6.13 , suggesting the formation of an H -bonding complex between $\mathbf{3}$ and $\mathbf{6}$ (Figure S8, B). After 5 h irradiation with Blue LEDs, the OHpeak of $\mathbf{3}$ significantly broadens and shifts from 6.13 to 6.20 ppm , suggesting enhanced hydrogen bonding upon irradiation (Figure S8, C). Finally, after 21 h irradiation, the OH -peak further shifts to 6.31 ppm (Figure S8, D). This is evidence that prolonged irradiation results in further generation of a strongly acidic species.

Figure S8: ${ }^{1} \mathrm{H}$ NMR spectra showing the hydroxy chemical shift of $\mathbf{3}$ compared to a $1: 1$ mixture of $\mathbf{3}$ and 6 before and after 5 h and 21 h irradiation with Blue LEDs ( 0.25 M in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ ).

The aromatic region for catalyst $\mathbf{3}$ and aldehyde $\mathbf{6}$ is shown in Figure S9, A and B. Up mixing of $\mathbf{3}$ and $\mathbf{6}$, the peaks broaden, suggesting formation of an H-bonding complex (Figure S9, C). Notably, the catalyst peaks at 7.11 ppm shift down filed by $\sim 0.05 \mathrm{ppm}$. After 18 h irradiation with Blue LEDs, the aromatic region shows little change (Figure S9, D).

Figure S9: NMR spectra showing the aromatic region of $\mathbf{3}$ and $\mathbf{6}$ compared to of a $1: 1$ mixture of $\mathbf{3}$ and $\mathbf{6}$ before and after 18 h irradiation with Blue LEDs ( 0.25 M in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ ).

2-naphthol (5):
The following aqueous stock solutions were prepared:

- 1 mg in 50 mL ; 2-naphthol (2-Nap) solution
- 0.10 M HCl
- 0.10 M NaOH
- $0.20 \mathrm{M} 1: 1 \mathrm{NH}_{3}-\mathrm{NH}_{4} \mathrm{Cl}$ buffer solution

Afterward, the solutions being analyzed were prepared in the following ratio:

- Acidic Solution: 10 mL of HCl solution, 5 mL of (2-Nap) solution diluted up to 50 mL with DI water
- Basic Solution: 10 mL of NaOH solution, 5 mL of (2-Nap) solution diluted up to 50 mL with DI water
- Buffer Solution: 10 mL of Buffer solution, 5 mL of (2-Nap) solution diluted up to 50 mL with DI water

The pH for those solutions were as follows (measured by Vernier Go Direct ${ }^{\mathrm{TM}}$ Electrode Amplifier):

- Acidic: 1.7
- Basic: 12.33
- Buffer: 9.48

[^3]The three solutions were analyzed using UV-Vis (Figure S10) and fluorometer (Figure S11).

Figure S10: UV-Vis for the acidic, basic, and buffer solutions of 5.

Figure S11: Fluorescence spectra for the acidic, basic, and buffer solutions of $\mathbf{5}$ (Excitation wavelength: 331 nm ).

From the acidic and basic solutions, the 0-0 energy was able to be calculated by overlaying the UV-Vis and fluorometer graphs (Figures S12 and S13).

Figure S12: Fluorescence and UV-Vis overlay of the acidic solution for 5 (Excitation wavelength: 331 nm ).

Figure S13: Fluorescence and UV-Vis spectra overlay of the basic solution for 5 (Excitation wavelength: 331 nm ).

The following calculations were performed to determine pKa and pKa :
To begin we must figure out the concentration of the analyte in the three solutions being tested;

$$
\begin{gathered}
\mathrm{M}_{1} \mathrm{~V}_{1}=\mathrm{M}_{2} \mathrm{~V}_{2} \\
\left(1.388 \times 10^{-4} \mathrm{M}\right)(5 \mathrm{~mL})=\mathrm{M}_{2}(50 \mathrm{~mL}) \\
\mathrm{M}_{2}=1.388 \times 10^{-5} \mathrm{M}=\mathrm{c}_{0}
\end{gathered}
$$

We must also calculate the molar absorptivity $(\varepsilon)$ of the acidic and basic forms of 2-naphthol at the wavelength of maximum absorbance for the conjugate base form from UV-Vis graphs:

$$
\mathrm{A}=\varepsilon \mathrm{bc} \mathrm{c}_{\mathrm{o}}
$$

$c_{0}=1.388 \times 10^{-5} \mathrm{M}$
$\mathrm{b}=1 \mathrm{~cm}$
$\mathrm{A}_{238 \text { ( } \mathrm{NOH})}=.137$
$\mathrm{A}_{238(\mathrm{NO}-)}=.460$

$$
\begin{aligned}
& \varepsilon_{(\mathrm{NOH})}=\frac{.137}{\left(1.388 \times 10^{-5}\right)}=9876.317 \\
& \varepsilon_{(\mathrm{NO}-)}=\frac{.460}{\left(1.388 \times 10^{-5}\right)}=33141.21
\end{aligned}
$$

Afterward, we can calculate the concentration of the $(\mathrm{NOH})$ and $\left(\mathrm{NO}^{-}\right)$in the buffer using the absorbance at the wavelength used previously and the following equations:

$$
\mathrm{A}=\left(\varepsilon_{\mathrm{NOH}}-\varepsilon_{\mathrm{NO}}\right)[\mathrm{NOH}]+\left(\varepsilon_{\mathrm{NO}}\right) \mathrm{c}_{\mathrm{o}}
$$

and

$$
c_{o}=[\mathrm{NOH}]+\left[\mathrm{NO}^{-}\right]
$$

$\mathrm{A}_{238 \text { (Buffer) }}=.250$
$\varepsilon_{(\mathrm{NOH})}=9876.317$
$\varepsilon_{(\mathrm{NO}-)}=33141.21$
$\mathrm{c}_{\mathrm{o}}=1.388 \times 10^{-5} \mathrm{M}$

$$
\begin{gathered}
{[\mathrm{NOH}]=\frac{A-((\varepsilon \mathrm{NO}-) \mathrm{co})}{(\varepsilon \mathrm{NOH}-\varepsilon \mathrm{NO}-)}} \\
{[\mathrm{NOH}]=\frac{.25-\left((33141.21)\left(1.388 \times 10^{-5}\right)\right)}{(9876.317-33141.21)}} \\
{[\mathrm{NOH}]=\left(9.026 \times 10^{-6} \mathrm{M}\right)} \\
\mathrm{c}_{0}-[\mathrm{NOH}]=\left[\mathrm{NO}^{-}\right] \\
\left(1.388 \times 10^{-5} \mathrm{M}\right)-\left(9.026 \times 10^{-6} \mathrm{M}\right)=\left(4.854 \times 10^{-6} \mathrm{M}\right)
\end{gathered}
$$

$\mathrm{pK} \mathrm{a}_{\mathrm{a}}$ for the buffered solution was determined using the following equation:

$$
\begin{gathered}
\mathrm{pK}_{\mathrm{a}}=\mathrm{pH}+\log \left(\frac{[\mathrm{NOH}]}{\left[\mathrm{NO}^{-}\right]}\right) \\
\mathrm{pK}_{\mathrm{a}}=9.48+\log \left(\frac{\left[9.026 \times 10^{-6} \mathrm{M}\right]}{\left[4.854 \times 10^{-6} \mathrm{M}\right]}\right) \\
\mathrm{pK}_{\mathrm{a}}=9.75
\end{gathered}
$$

Next you must first determine the wavelength at which the two graphs intersect in the overlay for both the acidic and basic solutions:

0-0 energy of acidic solution: 332 nm
0-0 energy of basic solution: 370 nm

$$
\begin{array}{ll} 
& \vartheta=\left(\frac{10^{7}}{\text { wavelength }(\mathrm{nm})}\right) \\
\vartheta_{O H}=30120 \mathrm{~cm}^{-1} \\
\vartheta_{N O^{-}}=27027 \mathrm{~cm}^{-1} &
\end{array}
$$

To calculate the $\mathrm{pK}_{\mathrm{a}}{ }^{*}$ the following forster equation was used:

$$
\mathrm{pK}_{\mathrm{a}}^{*}=\mathrm{pK}_{\mathrm{a}}-\left(\frac{\left[\mathrm{N}_{o} h c\right]}{[2.303 R T]}\right)\left(\vartheta_{O H}-\vartheta_{N O^{-}}\right)
$$

$\vartheta=$ wavenumber based on 0-0 energy for acidic and basic solutions
$\mathrm{N}_{\mathrm{o}}=$ Avagrado's number $=\left(6.022 \times 10^{23}\right)$
$h=$ Planck's constant $=\left(6.626 \times 10^{-34}\right)$
$c=$ speed of light $(\mathrm{cm})=\left(3 \times 10^{10}\right)$
R $=$ Gas Constant $=8.3145$
$\mathrm{T}=$ Room Temp $(\mathrm{K})=298$

$$
\mathrm{pK}_{\mathrm{a}}^{*}=9.75-\left(\frac{\left[\left(6.022 \times 10^{23}\right)\left(6.626 \times 10^{-34}\right)\left(3 \times 10^{10}\right)\right]}{[2.303(8.3145)(298)]}\right)(30120-27027)
$$

## 6-bromo-2-naphthol (3):

The following aqueous stock solutions were prepared:

- 1 mg in 50 mL ; 6-Bromo-2-Naphthol (6-Bromo) solution
- $\quad 0.10 \mathrm{M} \mathrm{HCl}$
- $\quad 0.10 \mathrm{M} \mathrm{NaOH}$
- $\quad 0.20 \mathrm{M} 1: 1 \mathrm{NH}_{3}-\mathrm{NH}_{4} \mathrm{Cl}$ buffer solution

Afterward, the solutions being analyzed were prepared in the following ratio:

- Acidic Solution: 10 mL of HCl solution, 5 mL of (6-Bromo) solution diluted up to 50 mL with DI water
- Basic Solution: 10 mL of NaOH solution, 5 mL of (6-Bromo) solution diluted up to 50 mL with DI water
- Buffer Solution: 10 mL of Buffer solution, 5 mL of (6-Bromo) solution diluted up to 50 mL with DI water

The pH for those solutions were as follows:

- Acidic: 1.73
- Basic: 12.45
- Buffer: 9.51

The three solutions were analyzed using UV-Vis and Fluorometer (Figures S14 and S15):

Figure S14: UV-Vis for the Acidic, Basic, and Buffer solutions of $\mathbf{3}$.

Figure S15: Fluorescence spectra for the acidic, basic, and buffer solutions of $\mathbf{3}$.

The 0-0 energy was calculated by overlaying the UV-Vis and fluorometer graphs for the acidic (Figure S16) and basic (Figure S17) solutions (Excitation wavelength: 274 nm ).

## 0-0 Energy for Acidic Solution

Figure S16: Fluorescence and UV-Vis overlay of the acidic solution for $\mathbf{3}$ (Excitation wavelength: 274 $\mathrm{nm})$.

Figure S17: Fluorescence and UV-Vis spectra overlay of the basic solution for $\mathbf{3}$ (Excitation wavelength: 274 nm ).

The following calculations were performed to determine pKa and pKa :
To begin we must figure out the concentration of the analyte in the three solutions being tested;

$$
\begin{gathered}
\mathrm{M}_{1} \mathrm{~V}_{1}=\mathrm{M}_{2} \mathrm{~V}_{2} \\
\left(8.97 \times 10^{-4} \mathrm{M}\right)(5 \mathrm{~mL})=\mathrm{M}_{2}(50 \mathrm{~mL}) \\
\mathrm{M}_{2}=8.97 \times 10^{-5} \mathrm{M}=\mathrm{c}_{\mathrm{o}}
\end{gathered}
$$

We must also calculate the molar absorptivity ( $\varepsilon$ ) of the acidic and basic forms of 6-Bromo-2-naphthol at the wavelength of maximum absorbance for the conjugate base form from UV-Vis graphs:

$$
\mathrm{A}=\varepsilon \mathrm{b} \mathrm{c}_{0}
$$

$c_{0}=8.97 \times 10^{-5} \mathrm{M}$
$\mathrm{b}=1 \mathrm{~cm}$
$\mathrm{A}_{238 \text { ( } \mathrm{NOH})}=.147$
$\mathrm{A}_{238(\mathrm{NO}-)}=.469$

$$
\begin{aligned}
& \varepsilon_{(\mathrm{NOH})}=\frac{.147}{\left(8.97 \times 10^{-5}\right)}=1638.796 \\
& \varepsilon_{(\mathrm{NO}-)}=\frac{.469}{\left(8.97 \times 10^{-5}\right)}=5228.539
\end{aligned}
$$

Afterwards we can calculate the concentration of the $(\mathrm{NOH})$ and $\left(\mathrm{NO}^{-}\right)$in the buffer using the absorbance at the wavelength used previously and the following equations:

$$
\begin{gathered}
\mathrm{A}=\left(\varepsilon_{\mathrm{NOH}}-\varepsilon_{\mathrm{NO}-}\right)[\mathrm{NOH}]+\left(\varepsilon_{\mathrm{NO}-}\right) \mathrm{c}_{\mathrm{o}} \\
\text { and } \\
\mathrm{c}_{\mathrm{o}}=[\mathrm{NOH}]+\left[\mathrm{NO}^{-}\right]
\end{gathered}
$$

$\mathrm{A}_{238 \text { (Buffer) }}=.250$
$\varepsilon_{(\mathrm{NOH})}=1638.796$
$\varepsilon_{(\mathrm{NO}-)}=5228.539$
$\mathrm{c}_{\mathrm{o}}=8.97 \times 10^{-5} \mathrm{M}$

$$
\begin{gathered}
{[\mathrm{NOH}]=\frac{A-((\varepsilon \mathrm{NO}-) \mathrm{co})}{(\varepsilon \mathrm{NOH}-\varepsilon \mathrm{NO}-)}} \\
{[\mathrm{NOH}]=\frac{.25-\left((5228.539)\left(8.97 \times 10^{-5}\right)\right)}{(1638.796-5228.539)}} \\
{[\mathrm{NOH}]=\left(6.101 \times 10^{-5} \mathrm{M}\right)} \\
\mathrm{c}_{0}-[\mathrm{NOH}]=\left[\mathrm{NO}^{-}\right] \\
\left(8.97 \times 10^{-5} \mathrm{M}\right)-\left(6.101 \times 10^{-5} \mathrm{M}\right)=\left(2.87 \times 10^{-5} \mathrm{M}\right)
\end{gathered}
$$

$\mathrm{pK}_{\mathrm{a}}$ for the buffered solution was determined using the following equation:

$$
\begin{gathered}
\mathrm{pK}_{\mathrm{a}}=\mathrm{pH}+\log \left(\frac{[\mathrm{NOH}]}{[\mathrm{NO}]}\right) \\
\mathrm{pK}_{\mathrm{a}}=9.51+\log \left(\frac{\left[6.101 \times 10^{-5} \mathrm{M}\right]}{\left[2.87 \times 10^{-5} \mathrm{M}\right]}\right) \\
\mathrm{pK}_{\mathrm{a}}=9.84
\end{gathered}
$$

Next, you must first determine the wavelength at which the two graphs intersect in the overlay for both the acidic and basic solutions:

1-0 energy of acidic solution: 328 nm
1-0 energy of basic solution: 374 nm
Afterwards use this equation to determine the corresponding wavenumbers $\left(\vartheta_{O H} \& \vartheta_{\mathrm{NO}^{-}}\right)$:

$$
\vartheta=\left(\frac{10^{7}}{\text { wavelength }(\mathrm{nm})}\right)
$$

$$
\begin{aligned}
& \vartheta_{O H}=30487.8 \mathrm{~cm}^{-1} \\
& \vartheta_{N O^{-}}=26737.97 \mathrm{~cm}^{-1}
\end{aligned}
$$

To calculate the $\mathrm{pK}_{\mathrm{a}}{ }^{*}$ the following forster equation was used:

$$
\mathrm{pK}_{\mathrm{a}}{ }^{*}=\mathrm{pK}_{\mathrm{a}}-\left(\frac{\left[N_{o} h c\right]}{[2.303 R T]}\right)\left(\vartheta_{O H}-\vartheta_{N O^{-}}\right)
$$

$\vartheta=$ wavenumber based on $0-0$ energy for acidic and basic solutions
$\mathrm{N}_{\mathrm{o}}=$ Avagrado's number $=\left(6.022 \times 10^{23}\right)$
$h=$ Planck's constant $=\left(6.626 \times 10^{-34}\right)$
$c=$ speed of light $(\mathrm{cm})=\left(3 \times 10^{10}\right)$
R $=$ Gas Constant $=8.3145$
$\mathrm{T}=$ Room Temp (K) = 298

$$
\mathrm{pK}_{\mathrm{a}}^{*}=9.84-\left(\frac{\left[\left(6.022 \times 10^{23}\right)\left(6.626 \times 10^{-34}\right)\left(3 \times 10^{10}\right)\right]}{[2.303(8.3145)(298)]}\right)(30487.8-26737.97)
$$

The singlet excited-state lifetimes for 2-naphthol (5, $\tau=6.8 \mathrm{~ns}$ ) and 6-bromo-2-naphthol (3, $\tau=0.049 \mathrm{~ns}$ ) were measurements in $80 \%$ ethanol (Figures S18 and S19). The short-lived $\mathrm{S}_{1}$ excited state for $\mathbf{3}$ is attributed to rapid intersystem crossing into a triplet excited state (not measured) due to the heavy atom effect (bromine).

Scheme S18: Singlet excited-state spectrum for 2-naphthol (5) in $80 \%$ ethanol.

Scheme S19: Singlet excited-state spectrum for 6-bromo-2-naphthol (3) in 80\% ethanol.

## VIII. Kessil LED set-up and emission spectra:

The general setup for the photoacid catalyzed procedure is shown in Figure S20.

Figure S20: General reaction setup.
We thank Kessil (https://kessil.com/science/PR160L.php) for providing the emission spectra for the PR160L - $370 \mathrm{~nm}, 456 \mathrm{~nm}, 390 \mathrm{~nm}$, and 160WE 40W Tuna Blue LEDs shown in Figures S21- S24, respectively. The Tuna Blue LEDs used in this study emit strongly from $408-535 \mathrm{~nm}$ with weak emission from 372-390 nm. Note: Tuna Blue LEDs are used with \%blue and intensity settings maximized.

PR160L- 370 nm Spectrum

Figure S21: Emission spectrum for Kessil 370 nm LEDs.

## PR160L-456 Spectrum

Figure S22: Emission spectrum for Kessil 456 nm LEDs.

## PR160L-390 Spectrum
