EXPERIMENTAL SECTION

Monomer conversion and microsphere yield

The monomer conversion and microsphere yield were determined gravimetrically. In the supernatant, there were still short-chain copolymers. So, the weight of copolymer products is the sum of the microspheres weight and the weight of the copolymer in the supernatant. The monomer conversion and the microsphere yield can be calculated according to the following equations:

$$\text{Monomer conversion \%} = W_c/W_m \times 100 \% \quad (1)$$

$$\text{Microsphere yield \%} = W_p/W_m \times 100 \% \quad (2)$$

where W_c is the weight of the copolymer formed, W_p is the weight of as-formed copolymer microspheres, and W_m is the weight of the monomers in the reaction system.

Size and particle size distribution of PBTMA microspheres

The particle size and size distribution of the PBTMA microspheres were determined by measuring over 100 microspheres in SEM images and calculated using the following formulas:

$$D_n = \sqrt[k]{\frac{\sum_{i=1}^k D_i}{N}} \quad (3)$$

$$D_w = \sqrt[k]{\frac{\sum_{i=1}^k D_i^4}{\sum_{i=1}^k D_i^3}} \quad (4)$$

$$\text{PSD} = D_w/D_n \quad (5)$$

$$CV = \sqrt{\frac{\sum_{i=1}^k (D_i - D_n)^2}{k-1}} / D_n \times 100\% \quad (6)$$

where D_n is the number average diameter, D_w is the weight average diameter, D_i is the diameter of the determined microsphere, N is the total number of the measured microspheres, PSD stands for the particle size distribution. CV stands for the coefficient of variation in diameter.

RESULTS AND DISCUSSION

Solubility parameter calculated according to method of Hoftyzer and Van Krevelen¹

The solubility parameter components (δ) could be predicted from group contributions, using the following equations:

$$\delta^2 = \delta_d^2 + \delta_p^2 + \delta_h^2 \quad (7)$$

$$\delta_d = \frac{\rho \sum F_{di}}{M} \quad (8)$$

$$\delta_p = \frac{\rho \sqrt{\sum F_{pi}^2}}{M} \quad (9)$$

$$\delta_h = \frac{\rho \sqrt{\sum E_{hi}}}{M} \quad (10)$$

where δ_d is theoretical estimate of dispersion forces; δ_p is theoretical estimate of polar forces; δ_h is theoretical estimate of hydrogen bonding; ρ represent the density of measured object; F means the molar attraction constant, as $\delta = \rho F/V$. M represent the relative molecular mass of measured object. (For $-CH_3$, $F_{di} = 420 \text{ (MJ/m}^3)^{1/2} \cdot \text{mol}^{-1}$, $F_{pi} = 0 \text{ (MJ/m}^3)^{1/2} \cdot \text{mol}^{-1}$, $E_{hi} = 0 \text{ J/mol}$; For $-CH_2-$, $F_{di} = 270 \text{ (MJ/m}^3)^{1/2} \cdot \text{mol}^{-1}$, $F_{pi} = 0 \text{ (MJ/m}^3)^{1/2} \cdot \text{mol}^{-1}$, $E_{hi} = 0 \text{ J/mol}$; For $-COO-$, $F_{di} = 390 \text{ (MJ/m}^3)^{1/2} \cdot \text{mol}^{-1}$, $F_{pi} = 490 \text{ (MJ/m}^3)^{1/2} \cdot \text{mol}^{-1}$, $E_{hi} = 7000 \text{ J/mol}$)

Solubility parameter of PBTMA copolymer determined by the cloud point titration method

80 mg of PBTMA copolymer was dissolved in 10 mL of acetone (the good solvent) and then transferred 1 mL solution in a test tube. Hexane (the poor solvent) was added dropwise until the solution began to appear turbidity. The solubility parameter of PBTMA can be calculated according to the following equation:

$$\delta(PBTMA) = \varphi_1 \delta_1 + \varphi_2 \delta_2 \quad (11)$$

where δ_1 is the solubility parameter of good solvent; φ_1 is the volume percentage of good solvent; δ_2 is the solubility parameter of poor solvent; φ_2 is the volume percentage of poor solvent. ($\delta(n\text{-hexane}) = 14.94 \text{ J}^{1/2} \cdot \text{cm}^{3/2}$; $\delta(\text{cyclohexane}) = 16.78 \text{ J}^{1/2} \cdot \text{cm}^{3/2}$; $\delta(n\text{-hexane}) = 19.2 \text{ J}^{1/2} \cdot \text{cm}^{3/2}$)

The experiment was also determined in acetone-cyclohexane system and ethyl formate-*n*-hexane system. The $\delta(PBTMA)$ was $18.3 \text{ J}^{1/2} \cdot \text{cm}^{3/2}$, $18.6 \text{ J}^{1/2} \cdot \text{cm}^{3/2}$, $18.1 \text{ J}^{1/2} \cdot \text{cm}^{3/2}$ determined in acetone-*n*-hexane system, acetone-cyclohexane system and ethyl formate-*n*-hexane system respectively. The average value was $18.3 \text{ J}^{1/2} \cdot \text{cm}^{3/2}$.
