## Experimental Section

## Materials

Reagents and solvents were purchased from Sigma-Aldrich Japan (Tokyo, Japan), Kanto Chemical (Tokyo, Japan), FUJIFILM Wako Chemicals (Osaka, Japan), and Tokyo Chemical Industry (Tokyo, Japan) and used as received unless specified otherwise. 1-Bromo-3-methoxypropane was acquired from Oakwood Chemical (Estill, SC, USA). Dehydrated tetrahydrofuran (THF) and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ were supplied by a solvent supply system (Kanto Chemical). 1-(3,5-Bis(trifluoromethyl)phenyl)-3-cyclohexyl-2-thiourea (TU) was prepared as reported previously. ${ }^{\mathrm{S} 1}$ Benzyl alcohol ( BnOH ) and 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) were vacuum distilled over $\mathrm{CaH}_{2}$ and stored in a nitrogen-filled glovebox. 1-Pyrenebutanol (PB) and TU were also dehydrated over $\mathrm{CaH}_{2}$ and stored in the glovebox.

## Methods

${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were acquired on JEOL 500 MHz JNM-ECX and JNM-ECX400SL instruments operated at 500 and 400 MHz for ${ }^{1} \mathrm{H}$ and at 125 and 100 MHz for ${ }^{13} \mathrm{C}$. Size-exclusion chromatography (SEC) in THF was performed at $40^{\circ} \mathrm{C}$ using an integrated Malvern Viscotek TDAmax SEC unit equipped with three TSK-gel (one G2000HHR and two GMHHR-H) columns connected in series, a right-angle light scattering detector, a refractive index (RI) detector, a viscometer detector, and a ultraviolet (UV) detector (Viscotec UV detector 2600). The obtained $M_{\mathrm{n}}$ and $\Xi_{\mathrm{M}}$ values were calibrated using polystyrene (PS) standards with molar masses ranging between 580 and $3.64 \times 10^{5} \mathrm{~g} \mathrm{~mol}^{-1}$. The measurement of $\mathbf{2 b}$ was performed using an integrated Tosoh HLC-8220 SEC unit equipped with three TSK-gel columns (super AW5000, super AW4000, and super AW3000) connected in series and an RI detector at $30^{\circ} \mathrm{C}$. Calibration was performed using PS standards ( 2500 to $1.1 \times 10^{6} \mathrm{~g} \mathrm{~mol}^{-1}$ ).

## Solubility testing of bis-MPA salts

Bis-MPA ( $268 \mathrm{mg}, 2.0 \mathrm{mmol}$ ) and nitrogen bases ( 2.0 mmol ) were mixed in an organic solvent ( 10 mL ) at $25^{\circ} \mathrm{C}$. Eight commercially available nitrogen bases were used for this purpose (Scheme S1). The solubilities of the bis-MPA salts were visually evaluated, as summarized in Table S1.

## Notes for Table S1

The difference in $\mathrm{p} K_{\mathrm{a}}$ between the acid and base $\left(\Delta \mathrm{p} K_{\mathrm{a}}=\mathrm{p} K_{\mathrm{a}}\right.$ [base] $-\mathrm{p} K_{\mathrm{a}}$ [acid] $)$ strongly correlates with the charge state of the acid-base complex. At $\Delta \mathrm{p} K_{\mathrm{a}}<-1$, it exists as a non-ionized cocrystal, while at $\Delta \mathrm{p} K_{\mathrm{a}}>$ 4 , it is an ionized salt. ${ }^{S 7}$ Although the $p K_{a}$ of bis-MPA has not been reported previously, its value is expected to be approximately 4 based on the data for similar carboxylic acids. The bis-MPA salts with B4-B8 exhibited good solubility in organic solvents, suggesting their dissolution in the form of ionic pairs. Nevertheless, there is no clear correlation between the utilized solvents and the $\mathrm{p} K_{\mathrm{a}}$ values of the amines.

Figure S1. ${ }^{1} \mathrm{H}$ NMR spectrum of the bis-MPA salt with $\mathbf{B 5}(\mathbf{A C 2})$ formed in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$.

## Direct cyclization of bis-MPA: Formation of AC1

Bis-MPA ( $5.45 \mathrm{~g}, 40 \mathrm{mmol}$ ) was mixed with triethylamine (TEA; $20 \mathrm{~mL}, 140 \mathrm{mmol}$ ) and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 80 mL ) under a nitrogen atmosphere. The solution was chilled in a dry ice/2-propanol bath to approximately -75 ${ }^{\circ} \mathrm{C}$ followed by the dropwise addition of a $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution ( 20 mL ) of triphosgene ( $4.78 \mathrm{~g}, 16 \mathrm{mmol}$ ) using an addition funnel. The reaction mixture was stirred under the chilled conditions for 90 min and then under ambient conditions for 2 h . After the precipitates comprising the byproduct triethylammonium chloride ( $\mathrm{TEAH}^{+} \mathrm{Cl}^{-}$) were filtered out, the filtrate was evaporated and dried under vacuum to obtain AC1. Alternatively, hexane ( 200 mL ) was gradually added to the filtrate to form the precipitates of TEAH ${ }^{+} \mathrm{Cl}^{-}$. AC1 was obtained from the filtrate after vacuum drying $(7.4 \mathrm{~g}, 71 \%)$. Note that THF was not an appropriate solvent for this reaction. The concomitant formation of an insoluble TEAH ${ }^{+} \mathrm{Cl}^{-}$salt in THF might negatively affect cyclization, confirming the formation of oligomers. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, ~ \delta$ ): 4.69 (d, $J=10.5$ $\left.\mathrm{Hz}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{H}_{\mathrm{b}}\right), 4.15\left(\mathrm{~d}, J=10.5 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{a} \underline{H}_{b}\right), 3.06\left(\mathrm{q}, J=7.3 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{NHC} \underline{H}_{2}\right), 1.32-1.24(\mathrm{~m}, 12 \mathrm{H}$, $\mathrm{CH}_{3}$ ).

Figure S2. ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{A C}$ 1 including more than 1 equivalent of triethylammonium relative to carboxylate ( 400 MHz , acetone- $d_{6}$ ).

Figure S3. ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{A C 1}$ including less than 1 equivalent of triethylammonium relative to carboxylate ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ).

## Formation of MTC-H

By treatment of AC1 with an ion exchange resin. AC1 ( $2.0 \mathrm{~g}, 7.6 \mathrm{mmol}$ ) was dissolved in dry THF and stirred with Amberlyst-15 (1.6 g) at $25^{\circ} \mathrm{C}$ for 2 h . After the resin was filtered out, the filtrate was evaporated at a reduced pressure. The obtained residue was washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to form a pale yellowish solid (1.1 $\mathrm{g}, 89 \%)$. The ${ }^{1} \mathrm{H}$ NMR spectrum matched that reported in the literature. ${ }^{58}{ }^{1} \mathrm{H}$ NMR ( 400 MHz , acetone- $d_{6}$, б): 4.67 (d, $\left.J=10.9 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{a} \mathrm{H}_{\mathrm{b}}\right), 4.36\left(\mathrm{~d}, J=10.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\mathrm{a}} \underline{H}_{b}\right), 1.32\left(\mathrm{~m}, 12 \mathrm{H}, \mathrm{CH}_{3}\right)$.

Figure S4. ${ }^{1} \mathrm{H}$ NMR spectrum of MTC-H obtained by the treatment of AC1 with an ion exchange resin (400 MHz , acetone- $d_{6}$ )

By catalytic hydrogenolysis. 1d $(8.0 \mathrm{~g}, 32 \mathrm{mmol})$, which was preliminarily synthesized as described elsewhere, ${ }^{\mathrm{S} 8}$ was dissolved in THF ( 160 mL ), and the resulting solution was degassed. Pd/C (10 wt. \%; 2.0 g) was dispersed in the solution, which was further degassed. Cyclohexene ( $32.5 \mathrm{~mL}, 320 \mathrm{mmol}$ ) was added to the reaction mixture and stirred at $60^{\circ} \mathrm{C}$ for 24 h . Afterward, the solution was degassed, and the insoluble part was removed using a glass filter with celite. The filtrate was evaporated, dried under vacuum and washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to form a white solid ( $4.7 \mathrm{~g}, 91 \%$ ). The obtained ${ }^{1} \mathrm{H}$ NMR spectrum matched that
reported in the literature. ${ }^{S 7}$

Figure S5. ${ }^{1} \mathrm{H}$ NMR spectrum of MTC-H obtained by hydrogenolysis ( 500 MHz , acetone- $d_{6}$ ).

## Optimization of the reaction conditions for the esterification of AC1 with benzyl bromide

 AC1 ( $260 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) was dissolved in acetonitrile $(0.67 \mathrm{~mL})$ followed by the addition of benzyl bromide ( $0.145 \mathrm{~mL}, 1.22 \mathrm{mmol}$ ). The resultant mixture was stirred at $25^{\circ} \mathrm{C}$ for a predetermined time. An aliquot was taken at certain time points to monitor the product formation by ${ }^{1} \mathrm{H}$ NMR. The obtained results are summarized in Table S2.Scheme S3. Esterification of AC1 with benzyl bromide for optimizing the reaction conditions.

Table S2. Esterification of AC1 with benzyl bromide ( BnBr ) under various conditions.

Synthesis of functionalized cyclic carbonates 1 from AC1 through esterification with alkyl bromides

Typical procedure: Synthesis of 1e. AC1 ( $1.0 \mathrm{~g}, 3.8 \mathrm{mmol}$ ) was mixed with tert-butyl bromoacetate ( 0.7 $\mathrm{mL}, 4.6 \mathrm{mmol})$ in acetonitrile $(2.6 \mathrm{~mL})$ and stirred at $25^{\circ} \mathrm{C}$. The product formation was monitored by ${ }^{1} \mathrm{H}$ NMR. The reaction mixture was concentrated under a reduced pressure, and the obtained residue was dispersed in THF to filter out precipitates. The filtrate was concentrated, and the residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and washed with brine twice. The organic layer was dried over $\mathrm{MgSO}_{4}$, evaporated, and dried under vacuum at $25^{\circ} \mathrm{C}$. The residue was purified by column chromatography using a mixed solvent of EtOAc and hexane ( $6: 4 \mathrm{v} / \mathrm{v}$ ) followed by recrystallization from toluene to obtain a white solid as $\mathbf{1 e}(0.23$ $\mathrm{g}, 22 \%)$. The ${ }^{1} \mathrm{H}$ NMR spectrum matched that reported in the literature. ${ }^{59}{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 4.76 (d, $J=10.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\underline{2}} \mathrm{H}_{\mathrm{b}} \mathrm{OCO}$ ), $4.60\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CO}\right), 4.25\left(\mathrm{~d}, J=10.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{a} \underline{H}_{\underline{b}} \mathrm{OCO}\right), 1.49$ (s, 9H, tert-Bu), 1.44 (s, 3H, $\mathrm{CH}_{3}$ ).

Figure S6. ${ }^{1} \mathrm{H}$ NMR spectrum of the reaction mixture showing the formation of $\mathbf{1 e}$ at $6 \mathrm{~h}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$. Inset: expanded region between 3.5 and 5.0 ppm.

Figure S7. ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1 e}$ derived from $\mathbf{A C 1}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$.

1f. The reaction was performed as described above for $\mathbf{1 e}$, using ethyl bromoacetate ( $0.51 \mathrm{~mL}, 4.6 \mathrm{mmol}$ ). The product formation was monitored by ${ }^{1} \mathrm{H}$ NMR. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): $4.77(\mathrm{~d}, \mathrm{~J}=11.3 \mathrm{~Hz}, 2 \mathrm{H}$, $\mathrm{CH}_{2} \mathrm{H}_{\mathrm{b}} \mathrm{OCO}$ ), 4.72 (s, 2H, $\mathrm{CH}_{2} \mathrm{CO}$ ), 4.28-4.21 (m, $6 \mathrm{H}, \mathrm{CH}_{2} \underline{H}_{\underline{2}} \mathrm{OCO}, \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), 1.43 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ), 1.30 (t, J $=11.3 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{3}$ ). ${ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta\right): 171.6,166.8,147.2,72.7,61.8,61.5,40.1,17.4$, 14.0.

Figure S8. ${ }^{1} \mathrm{H}$ NMR spectrum of 1 f derived from $\mathbf{A C 1}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$.

Figure S9. ${ }^{13} \mathrm{C}$ NMR spectrum of $\mathbf{1 f}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$.

$\mathbf{1 g}$. The reaction was performed as described above for $\mathbf{1 e}$, using allyl bromide ( $0.40 \mathrm{~mL}, 4.7 \mathrm{mmol}$ ). The product formation was monitored by ${ }^{1} \mathrm{H}$ NMR. The crude product was purified by column chromatography using a mixture of ethyl acetate and hexane ( $8: 2, \mathrm{v} / \mathrm{v}$ ) to produce a white solid as $\mathbf{1 g}(119 \mathrm{mg}, 16 \%)$. The obtained ${ }^{1} \mathrm{H}$ NMR spectrum matched that reported in the literature. ${ }^{510, \mathrm{~S} 11}{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 5.97-5.84 (m, 1H), 5.40-5.27 (m, 2H, CHCH2 $\underline{2}_{2}$ ), 4.75-4.66 (m, 4H, OCH2 $\underline{2}_{2} \mathrm{CH}, \mathrm{CH}_{\mathrm{a}} \mathrm{H}_{\mathrm{b}} \mathrm{OCOO}$ ), 4.21 ( $\mathrm{d}, \mathrm{J}=$ $\left.11.0 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{a} \underline{H}_{b} \mathrm{OCOO}\right), 1.35\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.

$\mathbf{1 h}$. The reaction was performed as described above for 1e, using 2-nitrobenzyl bromide ( $996 \mathrm{mg}, 4.6$ mmol ). The product formation was monitored by ${ }^{1} \mathrm{H}$ NMR.

1d. The reaction was performed as described above for $\mathbf{1 e}$, using AC1 ( $2.48 \mathrm{~g}, 9.5 \mathrm{mmol}$ ), acetonitrile ( 6.4 mL ), and benzyl bromide ( $1.4 \mathrm{~mL}, 11.5 \mathrm{mmol}$ ). The product formation was monitored by ${ }^{1} \mathrm{H}$ NMR. The crude product was purified by column chromatography using a mixture of ethyl acetate and hexane (6:4, $\mathrm{v} / \mathrm{v})$. The obtained ${ }^{1} \mathrm{H}$ NMR spectrum matched that reported in the literature. ${ }^{58}{ }^{1} \mathrm{H} \mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, б): 7.43-7.32 (m, 5H, Ar-H), 5.23 (s, 2H, PhCH $\underline{2}_{2}$ ), 4.72 ( $\mathrm{d}, \mathrm{J}=10.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\mathrm{a}} \mathrm{H}_{\mathrm{b}} \mathrm{OCOO}$ ), 4.22 ( $\mathrm{d}, \mathrm{J}=$ $\left.10.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{a} \underline{H}_{\underline{b}} \mathrm{OCOO}\right), 1.35\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.

Figure S10. ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1 d}$ derived from $\mathbf{A C 1}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$.

1a. The reaction was performed as described above for $\mathbf{1 e}$, using AC1 ( $261 \mathrm{mg}, 1.0 \mathrm{mmol}$ ), acetonitrile ( 0.67 mL ), and 2-bromoethyl methyl ether ( $0.114 \mathrm{~mL}, 1.2 \mathrm{mmol}$ ). The product formation was monitored by ${ }^{1} \mathrm{H}$ NMR.

1b. The reaction was performed as described above for 1a, using tetrahydrofurfuryl bromide $(0.130 \mathrm{~mL}$, 1.2 mmol ). The product formation was monitored by ${ }^{1} \mathrm{H}$ NMR. However, no reaction occurred after 10 days.

1c. The reaction was performed as described above for 1a, using 1-bromo-3-methoxypropane ( 0.135 mL , $1.2 \mathrm{mmol})$. The product formation was monitored by ${ }^{1} \mathrm{H}$ NMR.

1i. The reaction was performed as described above for 1a, using 1-bromobutane ( $0.130 \mathrm{~mL}, 1.2 \mathrm{mmol}$ ). The product formation was monitored by ${ }^{1} \mathrm{H}$ NMR.
$\mathbf{1 j}$. The reaction was performed as described above for 1a, using 1-bromo-4-methoxybutane ( 0.155 mL , 1.2 mmol ). The product formation was monitored by ${ }^{1} \mathrm{H}$ NMR.
$\mathbf{1 k}$. The reaction was performed as described above for $\mathbf{1 a}$, using 1-bromo-2-methylpropane ( 0.130 mL , 1.2 mmol ). The product formation was monitored by ${ }^{1} \mathrm{H}$ NMR. However, no reaction occurred after 24 h .

1I. The reaction was performed as described above for 1a, using bromoacetaldehyde dimethylacetal ( $0.160 \mathrm{~mL}, 1.0 \mathrm{mmol}$ ). The product formation was monitored by ${ }^{1} \mathrm{H}$ NMR. However, no reaction occurred after 2 days.

## Synthesis of bis-MPA esters 3 through esterification of AC2 and alkyl bromides

Typical procedure: Synthesis of 3 e . Bis-MPA ( $10.1 \mathrm{~g}, 74 \mathrm{mmol}$ ) and TEA ( $7.6 \mathrm{~g}, 76 \mathrm{mmol}$ ) were dissolved in acetonitrile $(250 \mathrm{~mL})$ at $60^{\circ} \mathrm{C}$ for 1 h . An acetonitrile solution ( 50 mL ) of tert-butyl bromoacetate ( $14.8 \mathrm{~g}, 76 \mathrm{mmol}$ ) was slowly added to the reaction mixture, which was continuously stirred at $60^{\circ} \mathrm{C}$ for 24 h . The resulting solution was concentrated, dissolved in EtOAc ( 50 mL ), and extracted with brine twice. The organic layer was dried over $\mathrm{MgSO}_{4}$, evaporated, and dried under vacuum to obtain a transparent oil as 3 e (15.6 g, 85\%). The obtained ${ }^{1} \mathrm{H}$ NMR spectrum matched that reported in the literature. ${ }^{59}{ }^{1} \mathrm{H}$ NMR (400 MHz, $\mathrm{CDCl}_{3}, \delta$ ): 4.63 (s, 2H, $\mathrm{OC}_{\underline{2}}^{2} \mathrm{CO}$ ), 3.82 ( $\mathrm{s}, 4 \mathrm{H}, \mathrm{C}_{2} \underline{\mathrm{OH}}$ ), 3.09-2.97 (br, $2 \mathrm{H}, \mathrm{O} \underline{H}$ ), 1.49 (s, 9 H , tert-Bu), 1.20 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ).

Figure S11. ${ }^{1} \mathrm{H}$ NMR spectrum of 3 e derived from $\mathbf{A C 2}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$.

3 g . The reaction was performed as described above for 3 e , using allyl bromide ( $9.1 \mathrm{~g}, 75 \mathrm{mmol}$ ) to produce $3 \mathrm{~g}(9.7 \mathrm{~g}, 75 \%)$. The obtained ${ }^{1} \mathrm{H}$ NMR spectrum matched that reported in the literature. ${ }^{\mathrm{S} 11}{ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \delta\right): 6.01-5.87\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}=\mathrm{CH}_{2}\right), 5.36\left(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=17.4 \mathrm{~Hz}, \mathrm{CH}=\mathrm{CH}_{2} \mathrm{H}_{\mathrm{b}}\right), 5.27$ (d, 1H, J=10.5 $\left.\mathrm{Hz}, \mathrm{CH}=\mathrm{CH}_{a} \underline{H}_{\underline{b}}\right), 4.68\left(\mathrm{~d}, 2 \mathrm{H}, J=5.5 \mathrm{~Hz}, \mathrm{COOC} \underline{H}_{2}\right), 3.94\left(\mathrm{~d}, 2 \mathrm{H}, J=11.4 \mathrm{~Hz}, \mathrm{CH}_{\underline{a}} \mathrm{H}_{\mathrm{b}} \mathrm{OH}\right), 3.74(\mathrm{~d}, 2 \mathrm{H}, J=$ $11.4 \mathrm{~Hz}, \mathrm{CH}_{a} \underline{H}_{\underline{-}} \mathrm{OH}$ ), $3.08-2.90(\mathrm{br}, 2 \mathrm{H}, \mathrm{OH}), 1.09\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.

b

3h. The reaction was performed as described above for $\mathbf{3 e}$, using 2-nitrobenzyl bromide ( $16.4 \mathrm{~g}, 7.6 \mathrm{mmol}$ ) to produce $3 \mathrm{~h}(15.9 \mathrm{~g}, 79 \%)$. The obtained ${ }^{1} \mathrm{H}$ NMR spectrum matched that reported in the literature. ${ }^{\mathrm{S} 12}$ ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 8.12 ( $\mathrm{d}, \mathrm{J}=8.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Ar}-\underline{H}$ ), 7.73-7.66 (m, 2H, Ar- $\underline{H}$ ), 7.57-7.47 (m, 1H, $\operatorname{Ar}-\underline{H}), 5.61\left(\mathrm{~s}, 2 \mathrm{H}, \operatorname{Ar}-\mathrm{CH}_{2}\right), 3.99\left(\mathrm{dd}, 2 \mathrm{H}, J=11.1,6.6 \mathrm{~Hz}, \mathrm{C}_{\underline{2}} \mathrm{H}_{\mathrm{b}} \mathrm{OH}\right.$ ), $3.78(\mathrm{dd}, 2 \mathrm{H}, J=11.6,6.1 \mathrm{~Hz}$, $\left.\mathrm{CH}_{\mathrm{a}} \underline{H}_{\underline{1}} \mathrm{OH}\right), 2.82(\mathrm{t}, 2 \mathrm{H}, \mathrm{J}=6.3 \mathrm{~Hz}, \mathrm{O} \underline{H}), 1.12\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{C}_{\underline{3}}\right)$.

Figure S13. ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{3 h}$ derived from $\mathbf{A C 2}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$.

3a. The reaction was performed as described above for $\mathbf{3 e}$, using bis-MPA ( $1.0 \mathrm{~g}, 7.3 \mathrm{mmol}$ ), TEA ( 0.76 $\mathrm{g}, 7.5 \mathrm{mmol})$, 2-bromoethyl methyl ether ( $1.04 \mathrm{~g}, 7.5 \mathrm{mmol}$ ), and a certain volume of acetonitrile to maintain the same concentration. The reaction was run for $72 \mathrm{~h}(0.45 \mathrm{~g}, 32 \%)$. The obtained ${ }^{1} \mathrm{H}$ NMR spectrum matched that reported in the literature. ${ }^{513}{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta\right): 4.34\left(\mathrm{t}, \mathrm{J}=4.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{OCOC} \underline{H}_{2}\right)$, $3.85\left(\mathrm{~d}, J=11.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{\mathrm{b}} \mathrm{OH}\right), 3.73\left(\mathrm{~d}, J=11.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\mathrm{a}} \mathrm{CH}_{\underline{b}} \mathrm{OH}\right), 3.63(\mathrm{t}, J=4.8 \mathrm{~Hz}, 2 \mathrm{H}$, $\mathrm{CH}_{2} \mathrm{O}$ ), $3.39\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 1.11\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.

3c. The reaction was performed as described above for 3a, using 1-bromo-3-methoxypropane ( $1.15 \mathrm{~g}, 7.5$ $\mathrm{mmol})$ to produce $3 \mathrm{c}(0.49 \mathrm{~g}, 33 \%)$. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta\right): 4.30\left(\mathrm{t}, \mathrm{J}=6.0 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{OCOC} \underline{H}_{2}\right), 3.87$
 3.34 (s, $3 \mathrm{H}, \mathrm{OC} \underline{H}_{3}$ ), 1.95 (quin, $J=5.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}$ ), $1.07\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.

## Synthesis of 1b from MTC-H

MTC-H ( $1.0 \mathrm{~g}, 6.2 \mathrm{mmol}$ ) derived from AC1 was dissolved in dry THF ( 40 mL ) under a nitrogen atmosphere. Oxalyl chloride ( $1.18 \mathrm{~g}, 9.3 \mathrm{mmol}$ ) was dissolved in dry THF ( 15 mL ) and slowly added to the MTC-H solution through an addition funnel. The obtained mixture was stirred at $25^{\circ} \mathrm{C}$ for 1 h , degassed, and evaporated. The residue was dried under vacuum and used in the subsequent reaction without purification (MTC-CI). Tetrahydrofurfuryl alcohol ( $0.64 \mathrm{~g}, 6.2 \mathrm{mmol}$ ) was dehydrated by $\mathrm{CaH}_{2}$ in dry THF $(15 \mathrm{~mL})$ and then mixed with TEA ( $0.68 \mathrm{~g}, 6.8 \mathrm{mmol}$ ) after removing $\mathrm{CaH}_{2}$ usiing a syringe filter (pore size: $0.45 \mu \mathrm{~m}$; PTFE). MTC-CI was dissolved in dry THF ( 20 mL ) followed by the slow addition of the THF solution of the alcohol over 30 min . The obtained mixture was stirred at $25{ }^{\circ} \mathrm{C}$ for 3 h , filtered to remove precipitates, and evaporated. The residue was purified by silica gel column chromatography using ethyl acetate as an eluent to obtain a clear oil as $1 \mathrm{~b}(0.65 \mathrm{~g}, 43 \%) .{ }^{1} \mathrm{H}$ NMR ( 400 MHz , acetone- $\mathrm{d}_{6}$, $\delta$ ): 4.67 (d, $\left.J=10.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\underline{a}} \mathrm{H}_{\mathrm{b}}\right), 4.38\left(\mathrm{~d}, J=10.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{a} \underline{H}_{\underline{b}}\right), 4.23-4.02\left(\mathrm{~m}, 3 \mathrm{H}, \mathrm{COOCH}_{2}, \mathrm{COOCH}_{2} \mathrm{C} \underline{H}\right)$, 3.86-3.63 (m, 2H, CHOC $\underline{H}_{2}$ ), 2.03-1.61 (m, 4H, CHCH $\underline{H}_{2}, \mathrm{CHCH}_{2} \mathrm{CH}_{2}$ ), 1.31 (s, $3 \mathrm{H}, \mathrm{CH}_{3}$ ). ${ }^{13} \mathrm{C}$ NMR (100 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \delta\right): 171.0,147.4,76.0,72.9,68.4,67.6,40.2,27.8,25.6,17.5$.

## Cyclization of bis-MPA esters 3 for synthesis of 1

Typical procedure: Synthesis of $1 \mathbf{e} .3 \mathrm{e}(12.5 \mathrm{~g}, 50 \mathrm{mmol})$ was dissolved in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, and the resulting solution was chilled in a dry ice/2-propanol bath at approximately $-75^{\circ} \mathrm{C}$. After pyridine ( $23.9 \mathrm{~g}, 0.3 \mathrm{~mol}$ ) previously dehydrated over KOH was added to the flask, a dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution ( 100 mL ) of triphosgene ( $7.46 \mathrm{~g}, 25 \mathrm{mmol}$ ) was added dropwise to the mixtureover 1.5 h under a nitrogen atmosphere. The reaction mixture was warmed to $25^{\circ} \mathrm{C}$ and stirred for 2 h . The reaction was terminated by the addition of a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ aqueous solution, and the organic layer was successively extracted with a 1 N HCl aqueous solution, a saturated $\mathrm{NaHCO}_{3}$ aqueous solution, and brine. The organic layer was dried over $\mathrm{MgSO}_{4}$, evaporated, and dried under vacuum to form a white solid, which was recrystallized from toluene ( 9.0 g , $65 \%)$. The obtained ${ }^{1} \mathrm{H}$ NMR spectrum matched that reported in the literature. ${ }^{59}{ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, $\delta): ~ 4.76$ (d, $J=10.9 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\underline{a}} \mathrm{CH}_{\mathrm{b}} \mathrm{OCO}$ ), $4.60\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{CO}\right), 4.25\left(\mathrm{~d}, \mathrm{~J}=10.9 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\mathrm{a}} \underline{\mathrm{H}}_{\underline{b}} \mathrm{OCO}\right)$, 1.48 (s, 9H, tert-Bu), 1.44 (s, 3H, $\mathrm{CH}_{3}$ ).

Figure S20. ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1 e}$ prepared from $\mathbf{3 e}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$.

$\mathbf{1 g}$. The reaction was performed as described above for $\mathbf{1 e}$, using $\mathbf{3 g}(4.4 \mathrm{~g}, 25 \mathrm{mmol}$ ), pyridine ( 11.9 g , 0.15 mol ), triphosgene ( $3.74 \mathrm{~g}, 12.6 \mathrm{mmol}$ ), and a certain volume of dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to maintain the same concentration ( $4.2 \mathrm{~g}, 83 \%$ ). The obtained ${ }^{1} \mathrm{H}$ NMR spectrum matched that reported in the literature. ${ }^{\mathrm{S10}, \mathrm{~S} 11}$ ${ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta\right): 5.99-5.84\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}=\mathrm{CH}_{2}\right), 5.41-5.26\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}=\mathrm{CH}_{2}\right)$, 4.78-4.62 (m, $\left.3 \mathrm{H}, \mathrm{OCOC} \underline{H}_{2}, \mathrm{CH}_{a} \mathrm{H}_{\mathrm{b}} \mathrm{OCOO}\right), 4.22\left(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=10.9 \mathrm{~Hz}, \mathrm{CH}_{a} \underline{H}_{\underline{b}} \mathrm{OCOO}\right), 1.37\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.

Figure S21. ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1 g}$ prepared from $\mathbf{3 g}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$.

1c. The reaction was performed as described above for $\mathbf{1 e}$, using $\mathbf{3 c}(1.06 \mathrm{~g}, 4.9 \mathrm{mmol})$, pyridine ( 2.3 g , 29 mol ), triphosgene ( $0.72 \mathrm{~g}, 2.4 \mathrm{mmol}$ ), and a certain volume of dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to maintain the same concentration. The crude product was purified by silica gel column chromatography using EtOAc as an eluent ( $0.76 \mathrm{~g}, 46 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): $4.70\left(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=10.5 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{H}_{\mathrm{b}} \mathrm{OCOO}\right.$ ), $4.32(\mathrm{t}, 2 \mathrm{H}$, $J=6.4 \mathrm{~Hz}, \operatorname{OCOC} \underline{H}_{2}$ ), $4.221\left(\mathrm{~d}, 2 \mathrm{H}, J=11.0 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{H}_{\mathrm{b}} \mathrm{OCOO}\right), 3.45\left(\mathrm{t}, 2 \mathrm{H}, J=6.2 \mathrm{~Hz}, \mathrm{OC} \underline{H}_{2}\right), 3.34(\mathrm{~s}$, $3 \mathrm{H}, \mathrm{OCH}_{3}$ ), 1.94 (quin, $J=6.3 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}$ ), $1.34\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta\right): 171.0$, 147.4, 73.0, 68.7, 63.5, 58.7, 40.1, 28.7, 17.5.

Estimation of degrees of polymerization (DPs) of resultant polymers. The DPs of the resultant polycarbonates were estimated from the integral values of the polymer main chains and the termination end groups in the ${ }^{1} \mathrm{H}$ NMR spectra. The signals for methylene neighboring hydroxy terminal groups and for acetyl terminal groups appear around 3.7 and 2.1 ppm , respectively. When alcohol initiators were used, NMR signals for the initiation end can be observed. However, the integral values were often less than those of the termination end, indicating concomitant initiation by impurities such as water and decarbonylated (or unreacted) diols derived from monomers. We assumed that the polymer chains initiated by the impurities have termination ends at both ends. In this case, the integral values of the termination end were regarded as the sum of those for polymer chains with single and double termination ends.

Figure S29. SEC traces of ROP products (THF, $40^{\circ} \mathrm{C}$ ).

## Note for Fig. S29.

Measurements of $\mathbf{2 b}$ were performed using a different SEC system with a different set of columns and settings.

## Platelet adhesion tests

Platelet adhesion tests were performed using spin-coated substrates as described elsewhere. ${ }^{\text {s13,S14 }}$ Briefly, the synthesized polymers were immersed in Miili-Q water for 24 h to eluviate water-soluble impurities and dried under vacuum prior to spin coating. Afterwards, $\mathrm{CHCl}_{3}$ solutions of the polymers with concentrations of $0.2 \mathrm{wt} . / \mathrm{v} \%(40 \mu \mathrm{~L})$ were spin-coated on poly(ethylene terephthalate) (PET) sheets ( $\varphi$ : 14 mm ; thickness: $125 \mu \mathrm{~m}$; Mitsubishi Plastics, Tokyo, Japan) at 500 rpm for $5 \mathrm{~s}, 2000 \mathrm{rpm}$ for 10 s , a slope of $5 \mathrm{~s}, 4000 \mathrm{rpm}$ for 5 s , and a slope of 4 s . The spin-coated substrates were dried in air for 10 min and re-coated via the same procedure.
The polymer-coated substrates, which were cut into squares with sizes of 8 mm , were sterilized by UV light on a clean bench for 2 h before use. Human whole blood purchased from Bizcom Japan (Tokyo, Japan) was centrifuged to obtain platelet-rich plasma (PRP) and platelet-poor plasma (PPP). The PRP and PPP were mixed to prepare platelet suspension plasma with a platelet concentration of $4 \times 10^{7}$ cells $\mathrm{cm}^{-2}$. This plasma ( $200 \mu \mathrm{~L}$ ) was applied to the polymer-coated substrates, which were subsequently incubated for 1 h at $37^{\circ} \mathrm{C}$. After washing with phosphate-buffered saline (PBS) twice, the substrates were immersed in a PBS solution containing $1 \mathrm{wt} . \%$ glutaraldehyde for 2 h at $37^{\circ} \mathrm{C}$ to fix the adherent platelets. The fixed samples were immersed in PBS for 10 min and then twice in a $1: 1$ mixture of PBS and Milli-Q water for 8 min . The immersed samples were washed with Milli-Q water and dried in air overnight. The air-
dried samples were sputter-coated with Pt-Pd (JFC-1200, JEOL) prior to observations by scanning electron microscopy (SEM; VE-9800, KEYENCE, Tokyo, Japan) conducted at accelerating voltages of 3-5 $\mathbf{k e V}$. The tests for $\mathbf{2 b}$ and $\mathbf{2 c}$ were conducted independently, using different platelet suspensions. During SEM observations, at least five images were randomly captured for each sample. Representative images of the platelets adhered to the polymer-coated substrates are shown in Figure S30. The adhered platelets were visually counted and then averaged to calculate the cell numbers per square centimeter for a quantitative analysis (Figure 4). For the evaluation of 2b, two substrates were used for each polymer. The average cell numbers were calculated from the counted values in 10 images ( 2 substrates $\times 5$ images). The same tests were repeated two more times to verify the reproducibility of the obtained data (see Figure $\mathbf{4 a}$ ). For the evaluation of $\mathbf{2 c}$, three substrates were used for each polymer, and the average cell numbers were computed from 15 images ( 3 substrates $\times 5$ images). The obtained results are summarized in Figure 4b. All data points were represented as the mean $\pm$ standard deviation. Statistical analyses included the analysis of variance (F-test) and Student's t-test conducted using Microsoft Excel in Microsoft 365. In all tests, $p<0.05$ was used as a statistical significance criterion.

Figure S30. Representative SEM images of the platelets adhered to the polymer substrates. The circles highlight the adhered platelets on 2a-2c.

(b)

Figure S31. (a) Numbers of adherent platelets on the polymer-coated substrates displayed as mean values with standard deviations ( $n=10$; 2 substrates $\times 5$ points per polymer). PMEA: poly(2-methoxyethyl acrylate). (b) Representative SEM image of the platelets adhered to PMEA. The circle highlights the adhered platelets.

## Note for Fig. S31a.

PMEA ( $M_{\mathrm{n}} 22 \mathrm{~kg} \mathrm{~mol}^{-1}, \bigoplus_{\mathrm{M}} 2.8$ ) was synthesized by free-radical polymerization and dissolved in methanol ( $0.2 \mathrm{wt} . / \mathrm{v} \%$ ) for spin-coating on the PET sheets as previously reported. ${ }^{\text {S13 }}$
