

Electronic Supplementary Information for:

Thermoresponsive star-shaped polymer with
heteroarm type with methacrylates: Preparation
by living radical polymerization method and its
topological effect

UV diagrams, traced by the transmittance with a 500 nm light beam, of 2 mg mL⁻¹ aqueous solution of P(DEGMA-*stat*-TEGMA) with different DEGMA:TEGMA ratio: heating or cooling rate 1 °C min⁻¹, heating up (red) and cooling down (blue). DEGMA:TEGMA = 50:50 (left), 75:25 (center), 85:15 (right).

Scheme S10. Synthesis of heteroarm star-shaped P(DEGMA-*stat*-TEGMA)/PMMA by Ru-catalyzed living radical polymerization.

Calculation of arm ratio and arm number of the heteroarm star-shaped P(DEGMA-*stat*-TEGMA)/PMMA

The molar ratio of DEGMA and TEGMA was determined from ¹H NMR spectrum of P(DEGMA-*stat*-TEGMA) in CDCl₃ by using the signal intensity ratio of the methylene ester group, the methylene ether group, and the methyl ether group of the side chain to be DEGMA:TEGMA = 83:17. The degree of polymerization (DP_n) of P(DEGMA-*stat*-TEGMA) was determined from ¹H NMR spectrum of P(DEGMA-*stat*-TEGMA) in DMSO-*d*₆ by using the signal intensity ratio of the phenyl group (5H) at the initiating end and the methylene ester group (2n H) to be 84, where n means DP_n . Thus, Mn of P(DEGMA-*stat*-TEGMA) was determined as 16,600 (= 84 × 188.2 × 0.83 + 84 × 232.3 × 0.17 + 198.7), which was close to the value obtained from SEC analysis. M_n of PMMA was obtained from

SEC analysis to be 8,200 and DP_n of PMMA was thus calculated to be 80.

Assuming the arm ratio of P(DEGMA-*stat*-TEGMA):PMMA is x:y, the signal intensity ratio of the methylene ester group (DEGMA/TEGMA) (signal f in Fig. 2), the methylene ether group (DEGMA/TEGMA) and methyl ester group (MMA) (signal e+i in Fig. 2), and the methyl ether group (DEGMA/TEGMA) (signal d in Fig. 2) is shown as

$$I_f : I_{e+i} : I_d = 84 \times 2 \times x : 84 \times (6 \times 0.83 + 10 \times 0.17) \times x + 80 \times 3 \times y : 3 \times x$$

, where I_f , I_{e+i} , and I_d means the intensities of signal f, e+i, and d, respectively.

From above equation, the arm ratio of P(DEGMA-*stat*-TEGMA):PMMA was determined as 73:27.

The arm number of the heteroarm star-shaped polymer was calculated as the following equation:

$$N_{\text{arm}} = \frac{M_{n(\text{star})} - MW_{(\text{EGDMA})} \times 10}{M_{n(P(\text{DEGMA} - \text{stat} - \text{TEGMA}))} \times 0.73 + M_{n(\text{PMMA})} \times 0.27} = 8.7$$
