## I. General

NMR spectra were recorded on JEOL $400 \mathrm{NMR}\left({ }^{1} \mathrm{H} 400 \mathrm{MHz} ;{ }^{13} \mathrm{C} 100 \mathrm{MHz}\right.$ ) in either $\mathrm{CDCl}_{3}, \mathrm{CD}_{3} \mathrm{OD}$ or DMSO- $d_{6}$. Abbreviations for data quoted are s , singlet; brs, broad singlet; d, doublet; t , triplet; dd, doublet of doublets; m , multiplet. The residual solvent signals were used as references and the chemical shifts converted to the TMS scale $\left(\mathrm{CDCl}_{3}: \delta_{\mathrm{H}}=7.26 \mathrm{ppm}, \delta_{\mathrm{C}}=77.16 \mathrm{ppm} ; \mathrm{CD}_{3} \mathrm{OD}: \delta_{\mathrm{H}}=3.31 \mathrm{ppm}, \delta_{\mathrm{C}}=49.00\right.$ ppm; $d_{6}$-DMSO: $\delta_{\mathrm{H}}=2.50 \mathrm{ppm}, \delta_{\mathrm{C}}=39.52 \mathrm{ppm}$ ). Mass spectra and high-resolution mass spectra were measured on an agilent TOF-G6230B mass spectrometer and Thermo-DFS mass spectrometer. Thin-layer chromatographies were done on pre-coated silica gel 60 F254 plates (Merck). Silica gel 60 H (200-300 mesh) and preparative TLC ( $200 \times 200 \mathrm{~mm}, 0.2-0.25 \mathrm{~mm}$ in thickness) manufactured by Qingdao Haiyang Chemical Group Co. (China) were used for general chromatography. $\left[\mathrm{Cp}^{*} \mathrm{IrCl}_{2}\right]_{2},\left[\mathrm{Cp}^{*} \mathrm{RhCl}_{2}\right]_{2},\left[\mathrm{Ru}(p-c y m e n e) \mathrm{Cl}_{2}\right]_{2}$ and CsOAc were purchased from Aldrich and used without further purification. Diazo compounds ${ }^{51}$ were synthesized according to published procedures. Other chemicals were purchased from commercial suppliers and were dried and purified when necessary. No attempts were made to optimize yields for substrate synthesis.

## II. Experimental Information and Characterization Data

General procedure for the synthesis of 2-hydroxy- $\boldsymbol{\beta}$-nitrostyrenes 1:

The synthesis of 2-hydroxy- $\beta$-nitrostyrenes $\mathbf{1}$ was conducted following a published procedure: ${ }^{\mathrm{S} 2}$ To a 25 mL flask were added nitromethane ( 2.67 mL ), $\mathrm{NH}_{4} \mathrm{OAc}(10.0$ $\mathrm{mmol})$ and acetic acid $(10.0 \mathrm{~mL})$ under the nitrogen atmosphere. The mixture was stirred at $100{ }^{\circ} \mathrm{C}$ after the addition of 2-hydroxybenzaldehyde ( 10.0 mmol ). The reaction mixture was heated at $100^{\circ} \mathrm{C}$ for 8 h . After cooling to ambient temperature, the reaction was filter and the filtrate was extracted with EA and brine. The desired 2-hydroxy- $\beta$-nitrostyrenes $\mathbf{1}$ was purified by column chromatography on silica gel.

Substrates 1a-n were known compounds and the characteristic data were in agreement with previous literature. ${ }^{\mathrm{S} 2}$

## ethyl-2-(4-hydroxy-3-(2-nitrovinyl)phenyl)-4-methylthiazole-5-carboxylate (10)

This compound was obtained in $28 \%$ yield $(0.9377 \mathrm{~g})$ as yellow solid. Eluent: PE/EA $=5 / 1 . \mathrm{R}_{\mathrm{f}}=0.2$. m.p.: 203-205 ${ }^{\circ} \mathrm{C}$.
${ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 11.65$ (brs, 1H), 8.50-8.11 (m, 3H), $7.90(\mathrm{~s}, 1 \mathrm{H})$, 7.04-7.02 (m, 1H), 4.37-4.19 (m, 2H), 2.62 ( $\mathrm{s}, 3 \mathrm{H}$ ), $1.30(\mathrm{t}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H})$.
${ }^{13}$ C NMR ( 100 MHz, DMSO- $\boldsymbol{d}_{\boldsymbol{6}}$ ): $\delta 168.2,161.4,160.7,160.1,138.4,134.5,131.3$, 130.3, 124.1, 120.3, 117.5, 116.8, 61.0, 17.2, 14.1.

## Optimization studies:

The mixture of 2-hydroxy- $\beta$-nitrostyrene 1a ( $0.1 \mathrm{mmol}, 1.0$ equiv), 3-diazopentane-2,4-dione 2a ( $0.11 \mathrm{mmol}, 1.1$ equiv), catalyst ( $\mathrm{x} \mathrm{mol} \%$ ) and base ( 1 equiv) in the solvent was stirred in an oil bath without exclusion of air or moisture. Afterwards, it was diluted with EtOAc and filtered through a short silica gel column to remove the metal residues. Then, the reaction mixture was concentrated and purified by preparative TLC (eluent: $\mathrm{PE} / \mathrm{EA}=10 / 1$ ) to afford the corresponding product 3aa.

General procedure for the $\mathbf{R h}$ (III)-catalysed carbene transfer reaction:

The mixture of 2-hydroxy- $\beta$-nitrostyrenes $\mathbf{1}(0.2 \mathrm{mmol}, 1.0$ equiv), diazo compounds 2 ( $0.22 \mathrm{mmol}, 1.1$ equiv), $\left[\mathrm{Cp}^{*} \mathrm{RhCl}_{2}\right]_{2}(2.5 \mathrm{~mol} \%)$ and CsOAc ( 1.0 equiv) in THF ( 1.0 mL ) was stirred at $60{ }^{\circ} \mathrm{C}$ for 24 h without exclusion of air or moisture. Afterwards, the mixture was diluted with EtOAc and filtered through a short silica gel column to remove the metal residues. Then, the reaction mixture was concentrated and purified by preparative TLC to give the desired benzofuran derivatives 3 .

## III. Experimental Mechanistic Studies

Deuterium-labeling experiment:

1a ( $0.1 \mathrm{mmol}, 1$ equiv) was dissolved in THF $(0.5 \mathrm{~mL})$ in the presence of CsOAc (1 equiv) and $\mathrm{CD}_{3} \mathrm{OD}$ (20.0 equiv). The mixture was stirred at $60^{\circ} \mathrm{C}$ in an oil bath for 2 h . Afterwards, the mixture was diluted with EtOAc and transferred to a round bottom flask. The solvent was evaporated under reduced pressure and the recovered 1a was purified by preparative TLC. The deuterium incorporation was analyzed by ${ }^{1} \mathrm{H}-\mathrm{NMR}$, the result showed that approximate $36 \%$ deuteration was detected at the $\beta$-position of the nitro group in 1a, while no obvious deuterium incorporation was detected at the $\alpha$-position of the nitro group.

1a ( $0.1 \mathrm{mmol}, 1$ equiv) was dissolved in THF $(0.5 \mathrm{~mL})$ in the presence of $\left[\mathrm{Cp}^{*} \mathrm{RhCl}_{2}\right]_{2}(2.5 \mathrm{~mol} \%), \mathrm{CsOAc}\left(1\right.$ equiv) and $\mathrm{CD}_{3} \mathrm{OD}$ (20.0 equiv). The mixture was stirred at $60^{\circ} \mathrm{C}$ in an oil bath for 2 h . Afterwards, the mixture was diluted with EtOAc and transferred to a round bottom flask. The solvent was evaporated under reduced pressure and the recovered 1a was purified by preparative TLC. The deuterium incorporation was analyzed by ${ }^{1} \mathrm{H}-\mathrm{NMR}$, the result showed that approximate $81 \%$ deuteration (see the doublet at $\delta 8.03$ ) was detected at the $\beta$-position of the nitro group in 1a, while only $7 \%$ deuterium incorporation (see the doublet at $\delta$ 8.16) was detected at the $\alpha$-position of the nitro group.

The mixture of 2-hydroxy- $\beta$-nitrostyrene $\mathbf{1 a}$ ( 0.1 mmol , 1 equiv), diazo compound 2a (1.1 equiv), $\left[\mathrm{Cp} * \mathrm{RhCl}_{2}\right]_{2}\left(2.5 \mathrm{~mol} \%\right.$ ), CsOAc ( 1.0 equiv) and $\mathrm{CD}_{3} \mathrm{OD}$ (20.0 equiv) in THF ( 0.5 mL ) was stirred at $60^{\circ} \mathrm{C}$ in an oil bath for 2 h without exclusion of air or moisture. Afterwards, the solvent was removed under reduced pressure, and the resulted mixture was purified by preparative TLC to afford the corresponding product 3aa. The deuterium incorporation was analyzed by ${ }^{1} \mathrm{H}-\mathrm{NMR}$. The result showed $26 \%$ (see the singlet at $\delta 6.96$ ) deuteration at the $\mathrm{C}_{3}$-position of benzofuran skeleton and $17 \%$ (see the multiplet at $\delta$ 2.07-2.05) deuteration at the methyl group.

The mixture of 2 -hydroxy- $\beta$-nitrostyrene $1 \mathbf{1 a}$ ( 0.1 mmol , 1 equiv), diazo compound 2c (1.1 equiv), $\left[\mathrm{Cp} * \mathrm{RhCl}_{2}\right]_{2}\left(2.5 \mathrm{~mol} \%\right.$ ), $\mathrm{CsOAc}\left(1.0\right.$ equiv) and $\mathrm{CD}_{3} \mathrm{OD}$ (20.0 equiv) in THF ( 0.5 mL ) was stirred at $60^{\circ} \mathrm{C}$ in an oil bath for 2 h without exclusion of air or moisture. Afterwards, the solvent was removed under reduced pressure, and the resulted mixture was purified by preparative TLC to afford the corresponding product 3ac. The deuterium incorporation was analyzed by ${ }^{1} \mathrm{H}-\mathrm{NMR}$. The result showed $23 \%$ (see the singlet at $\delta 6.96$ ) deuteration at the $\mathrm{C}_{3}$-position of benzofuran skeleton and $11 \%$ (see the singlet at $\delta 5.43$ ) deuteration at the $\alpha$ position of the ester group.

## IV. Bioactivity Assay and Molecular Docking

## Identify the 2-functionalized benzofurans as tyrosinase inhibitors:

The mushroom tyrosinase inhibitory activity was determined by following the previously described method ${ }^{\mathrm{S3}}$ with slight modifications. Briefly, $168 \mu \mathrm{~L}$ of phosphate buffer ( $0.1 \mathrm{M}, \mathrm{pH} 6.8$ ), $10 \mu \mathrm{~L}$ of mushroom tyrosinase $(0.001 \mathrm{mg} / \mathrm{mL}$, Sigma Chemical, USA) and $2 \mu \mathrm{~L}$ of the inhibitor solution were placed in the wells of a 96-well micro plate. After pre-incubation for 20 min at $37{ }^{\circ} \mathrm{C}, 20 \mu \mathrm{~L}$ of $2.0 \mathrm{mg} / \mathrm{mL}$ L-DOPA (3,4-dihydroxyphenylalanine, Sigma Chemical, USA) was added and the enzyme activity was measured at 475 nm every 60 seconds for 180 seconds in a Microplate Reader (Bio-Rad Laboratories, Inc., Hercules, CA, USA). Kojic acid was used as positive control and phosphate buffer was used as negative control. The extent of inhibition by the test compounds was expressed as the percentage of concentration necessary to achieve $50 \%$ inhibition $\left(\mathrm{IC}_{50}\right)$. The percentage of inhibition was calculated as follows: Inhibitory rate $(\%)=[\mathrm{Ac}-\mathrm{At}) / \mathrm{Ac}] \times 100$. Ac is the absorbance of the negative control and At is the absorbance of the test compound. Each
concentration was analyzed in three independent experiments run in triplicate. The $\mathrm{IC}_{50}$ values were determined by the data analysis software GraphPad Prism 8.

The results of the tested compounds are shown below:

## Molecular docking between tyrosinase and compound 3la:

Molecular docking was performed on the most potent compound 3la to explore the probable interaction model of the target compounds and the mushroom tyrosinase (PDB ID:2Y9X) active site. The most potent compound 3la was prepared by Prepare Ligands (Discovery studio 2019) in their neutral form and their conformation optimized in the CHARMm force field. The protein structure was prepared by using one of the eight monomers from the PDB entry, and using the model of Prepara Protein (Discovery studio 2019) for adding missing residues, hydrogen atoms as well
as removing water molecules and spectator ions. Then their conformation optimized in the CHARMm force field. The search grid of binding site was identified as center_x: -10.021, center_y: -28.823, and center_z: -43.596 with Radius value of 10 . Molecular modeling simulations were performed with CDOCKER protocol (Discovery studio 2019), reporting the 10 top ranked poses for each ligand and generation of figure was done by PyMOL (Schrödinger).
