1. General information and starting materials

1.1 General information

Unless otherwise noted, all materials were purchased from commercial suppliers. Dichloromethane (DCM) and chlorobenzene were refluxed over CaH₂; tetrahydrofuran (THF) was refluxed over lithium aluminum hydride. The solvents were freshly distilled prior to use. Column chromatography was performed on silica gel (normal phase, 200-300 mesh) from Anhui Liangchen Silicon Material Co., Ltd, with petroleum ether (PE, bp. 60 – 90 °C) and ethyl acetate (EA) as eluent. Reactions were monitored by thin-layer chromatography (TLC) on GF254 silica gel plates (0.2 mm) from Anhui Liangchen Silicon Material Co., Ltd. The plates were visualized by UV light, and other TLC stains (1% potassium permanganate in water; 10 g of iodine absorbed on 30 g of silica gel). ¹H and ¹³C NMR spectra were recorded on a Bruker 400 MHz spectrometer, usually in CDCl₃ as an internal standard, and the chemical shifts (δ) were reported in parts per million (ppm). Multiplicities are indicated as s (singlet), d (doublet), t (triplet), q (quartet), dd (double doublet), m (multiplet), and b (broad). Coupling constants (J) are reported in Hertz (Hz). HRMS measurements were carried out on an Agilent LC/MSD TOF mass spectrometer. GC-MS measurements were carried out on a Trace 1300 GC/ISQ QD mass spectrometer. Melting points were obtained on a Yanaco MP-500 melting point apparatus and are uncorrected. X-ray diffraction data were collected on a Rigaku Gemin E diffractometer. IR spectra (KBr pellets, ν (cm⁻¹)) were taken on a Bruker Tensor 27 spectrometer. All thiadiazoles 1 were previously synthesized in our previous publications.¹

Scheme S1. Reaction of 1,2,3-thiadiazoles with internal alkynes

Procedure: To an oven-dried reaction tube equipped with a magnetic stirring bar was added 1,2,3-thiadiazole 1a (28.4 mg, 0.1 mmol, 1.0 equiv), alkyne 2a (0.2 mmol, 2.0 equiv), [Rh(cod)Cl]₂ (2.5 mg, 0.005 mmol) and DPPF (6.7 mg, 0.012 mmol). The tube was sealed immediately with a rubber stopper and protected with a nitrogen balloon by evacuation-backfill operations for three times, then dry PhCl (1 mL) was injected to the
tube. The mixture was heated at 130 °C for 6 h. The mixture was detected by TLC and was analyzed by GC-MS.

(1) Carboxylic acid (5 mmol, 1.0 equiv) was dissolved in 25 mL of CH₂Cl₂ in a 50 mL round-bottom flask with a magnetic stirring bar. One drop of DMF was added, followed by slow addition of (COCl)₂ (635 mg, 7.5 mmol, 1.5 equiv) to the mixture at room temperature. The obtained solution was stirred for 4 h at room temperature. The acyl chloride was obtained after evaporating the solvent and used directly in next step without further purification.

(2) Phosphorus ylide (1.74 g, 5 mmol, 1.0 equiv) and Et₃N (0.7 mL, 5 mmol, 1.0 equiv) were successively dissolved in 15 mL of CH₂Cl₂ in a 50-mL round-bottom flask with a stir bar. To the stirring mixture, a solution of acyl chloride (5 mmol, 1.0 equiv) in 100 mL of CH₂Cl₂ was slowly added at room temperature. After the addition was finished, the reaction mixture was stirred for further 2 h at room temperature. The solvent was evaporated under reduced pressure, and the crude mixture was treated with petroleum ether (25 mL) and was allowed to sit undisturbed for 30 min. The mixture was filtered and the filtrate was evaporated. The crude residue was purified by column chromatography on silica gel to afford allenic ester.

3.1 Synthesis and Characterization of Products 3 and 3’

To an oven-dried reaction tube equipped with a magnetic stirring bar was added 1,2,3-thiadiazole 1 (0.1 mmol, 1.0 equiv), allene 2 (0.2 mmol, 2.0 equiv), [Rh(cod)Cl]₂ (2.5 mg, 0.005 mmol, 5 mol %), and DPPB (5.1 mg, 0.012 mmol, 12 mol %). The tube was sealed immediately with a rubber stopper and protected with a nitrogen balloon by evacuation-backfill operations for three times; then PhCl (1 mL) was injected to the tube. The mixture was heated at 130 °C in a heating block for 2 h. When the reaction was finished, as detected by TLC, the solvent was evaporated under reduced pressure. A small portion of the crude reaction mixture was submitted to ¹H NMR test to determine the regioselective ratios. After NMR test, the combined crude reaction mixture was subjected to column chromatography on silica gel, affording the corresponding major products 3. In some cases, the other regioisomer was also separated, if its yield was enough high.

3.4 1-mmol scale reaction
a) To a dried round-bottom flask equipped with a magnetic stirring bar was added 1,2,3-thiadiazole 1a (284 mg, 1 mmol, 1.0 equiv), allene 2C (376 mg, 2 mmol, 2.0 equiv), [Rh(cod)Cl]₂ (25 mg, 0.05 mmol, 5 mol %), and DPPB (51 mg, 0.12 mmol, 12 mol %). The flask was sealed immediately and protected with a nitrogen balloon by evacuation-backfill operations for three times; then PhCl (6 mL) was injected to the flask. The mixture was heated at 130 °C in an oil-bath for 12 h. When the reaction was finished, as detected by TLC, the solvent was evaporated under reduced pressure. A small portion of the crude reaction mixture was submitted to ¹H NMR test to determine the regioselective ratios. After NMR test, the combined crude reaction mixture was subjected to column chromatography on silica gel, affording the corresponding major products 3aC (151 mg, 34%).

b) To a dried round-bottom flask equipped with a magnetic stirring bar was added 1,2,3-thiadiazole 1a (284 mg, 1 mmol, 1.0 equiv), [Rh(cod)Cl]₂ (25 mg, 0.05 mmol, 5 mol %), and DPPB (51 mg, 0.12 mmol, 12 mol %). The flask was sealed immediately and protected with a nitrogen balloon by evacuation-backfill operations for three times; then PhCl (6 mL) was injected to the flask. The mixture was heated at 130 °C in an oil-bath. Then allene 2C (75 mg, 0.4 mmol) was added to the flask every one hour and was repeated five times (total amount: 375 mg, 2 mmol, 2 equiv). Upon the last addition of 2C, the mixture was stirred for additional 4 h, followed by further addition of [Rh(cod)Cl]₂ (12.5 mg, 0.025 mmol, 2.5 mol %), and DPPB (26 mg, 0.06 mmol, 6 mol %). After 14 h, the solvent was evaporated under reduced pressure, and the crude mixture was subjected to flash chromatography on silica gel affording the corresponding product 3aC (204 mg, 46%).
To a dried round-bottom flask equipped with a magnetic stirring bar was added 1,2,3-thiadiazole 1p (202 mg, 1 mmol, 1.0 equiv), allene 2A (252 mg, 2 mmol, 2.0 equiv), [Rh(cod)Cl]$_2$ (25 mg, 0.05 mmol, 5 mol %), and DPPB (51 mg, 0.12 mmol, 12 mol %). The flask was sealed immediately and protected with a nitrogen balloon by evacuation-backfill operations for three times; then PhCl (6 mL) was injected to the flask. The mixture was heated at 130 °C in an oil-bath for 8 h. When the reaction was finished, as detected by TLC, the solvent was evaporated under reduced pressure. A small portion of the crude reaction mixture was submitted to $^1$H NMR test to determine the regioselective ratios. After NMR test, the combined crude reaction mixture was subjected to column chromatography on silica gel, affording the corresponding major products 3pA (280 mg, 93%).

3.5 Deuterium Experiments

![Deuterium Experiments Diagram]

Synthesis of 2-(4-Chlorophenyl)acetic-$2,2$-$d_2$ acid:

In a two-neck flask (10 mL), equipped with a magnetic stir bar and reflux condenser, NaH 60% in mineral oil (504 mg, 35 mmol, 3.5 equiv) was added slowly to D$_2$O (8 mL) at 0 °C under argon atmosphere. 2-(4-Chlorophenyl)acetic acid (1.7 g, 10 mmol, 1.0 equiv) was added and the mixture was heated at reflux at 100 °C for 12 h. After completion of reaction (as determined by $^1$H NRM), the reaction mixture was acidified with 4 N HCl to a pH of 2 and extracted with DCM. The combined organic layers were dried over MgSO$_4$ and concentrated in vacuo to afford crude product (1.6 g, 93% yield) and used for the next step without further purification.

Synthesis of allenic ester 2G-$d$:

1) Crude 2-(4-chlorophenyl)acetic-$2,2$-$d_2$ acid (863 mg, 5 mmol, 1.0 equiv) was dissolved in 25 mL of CH$_2$Cl$_2$ in a 50-mL round-bottom flask equipped with a magnetic stirring bar, followed by addition of one drop of DMF and slow addition of (COCl)$_2$ (634 mg, 7.5 mmol, 1.5 equiv) at room temperature. The solution was stirred for 4 h at
room temperature. The acyl chloride was obtained after evaporating the solvent and used without further purification.

2) Phosphorus ylide (1.74 g, 5 mmol, 1.0 equiv) was dissolved in 15 mL of CH$_2$Cl$_2$ in a 50-mL round-bottom flask with a stir bar, followed by addition of Et$_3$N (0.7 mL, 5 mmol, 1.0 equiv). To the stirring mixture, a solution of acyl chloride (955 mg, 5 mmol, 1.0 equiv) in 10 mL of CH$_2$Cl$_2$ was slowly added at room temperature. After the addition was finished, the reaction mixture was stirred for further 2 h at room temperature, then the solvent was evaporated under reduced pressure. The crude mixture was treated with petroleum ether (25 mL), and was allowed to sit undisturbed for 30 min. The mixture was filtered and the filtrate was evaporated. The crude residue was purified by column chromatography on silica gel to afford the title allenic ester 2G-$d$.

Experimental
Single crystals of $\text{C}_{23}\text{H}_{20}\text{O}_2\text{S}$ 8aC were recrystallised from petroleum ether and tetrahydrofuran and transferred to the cold gas stream of the diffractometer.

Crystal structure determination of 8aC
Crystal Data. $\text{C}_{23}\text{H}_{20}\text{O}_2\text{S}, M = 360.45$, monoclinic, $a = 8.7228(5)$ Å, $b = 8.0994(4)$ Å, $c = 26.1056(16)$ Å, $\beta = 97.170(6)^\circ$, $U = 1829.94(18)$ Å$^3$, $T = 113.75(10)$, space group $P2_1/n$ (no. 14), $Z = 4$, $\mu(\text{Mo K}\alpha) = 0.191$, 13871 reflections measured, 3569 unique ($R_{int} = 0.0527$) which were used in all calculations. The final $wR(F_2)$ was 0.1025 (all data).
