1. General

¹H NMR and ¹³C NMR spectra were recorded on a Varian 400 MHz spectrometer. Chemical shifts were reported in ppm from tetramethylsilane with the solvent resonance as the internal standard (CDCl_3 : $\delta = 7.26$). Spectra were reported as follows: chemical shift (δ ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, p = quintet, m = multiplet, w = wide), coupling constants (Hz) and integration. ¹³C NMR spectra were collected on commercial instruments (100 MHz) with complete proton decoupling. Chemical shifts were reported in ppm from the tetramethylsilane with the solvent resonance as internal standard (CDCl_3 : $\delta = 77.0$). ESI-HRMS spectra were recorded on a commercial apparatus and methanol or acetonitrile was used to dissolve the sample. Reagents obtained from commercial sources were used without further purification. CH_2Cl_2 were distilled over CaH_2 before use. The THF and other solvents were distilled from sodium benzophenone ketyl before use. Purifications of the products were carried out by flash chromatography.

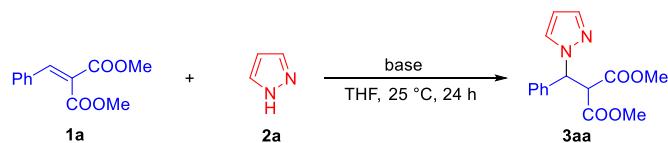

2. Typical procedure for the direct aza-Michael additions

The reactions were performed with α,β -unsaturated malonates **1** (0.50 mmol), azoles **2** (0.75 mmol) and Cs_2CO_3 (0.05 mmol) in THF (0.5 mL) at 25 °C. The reaction mixtures were stirred at 25 °C for 24 h. Then, the solvents were removed under reduced pressure, and the residues were purified by flash chromatography on silica gel by gradient elution with PE/EA = 8/1 to 3/1 to afford the azole derivatives **3**.
