Fig. S1: (a) Expanded view and Lorentzian peak fit of the diffraction line at $2\theta = 33^\circ$; and (b) size dependent orthorhombic distortion (i.e. a/b ratio) vs. particle size x . The experimental data were fitted according to Eq. 2 of Ishikawa et al [1].

Fig. S2: The variation of the lattice parameter a with the particle size.

Fig. S3: TEM images of the (a) 1.8 μm (b) 580 nm (c) 240 nm (d) 50 nm and (e) 14 nm bismuth titanate powders. Insets are the histogram reflecting the particle size distribution of the powders.

Fig. S4: Raman spectra of the (a) 1.8 μm , (b) 240 nm, and (c) 14 nm bismuth titanate powders as a function of temperature. All the spectra are corrected with the Bose-Einstein occupation factor.
