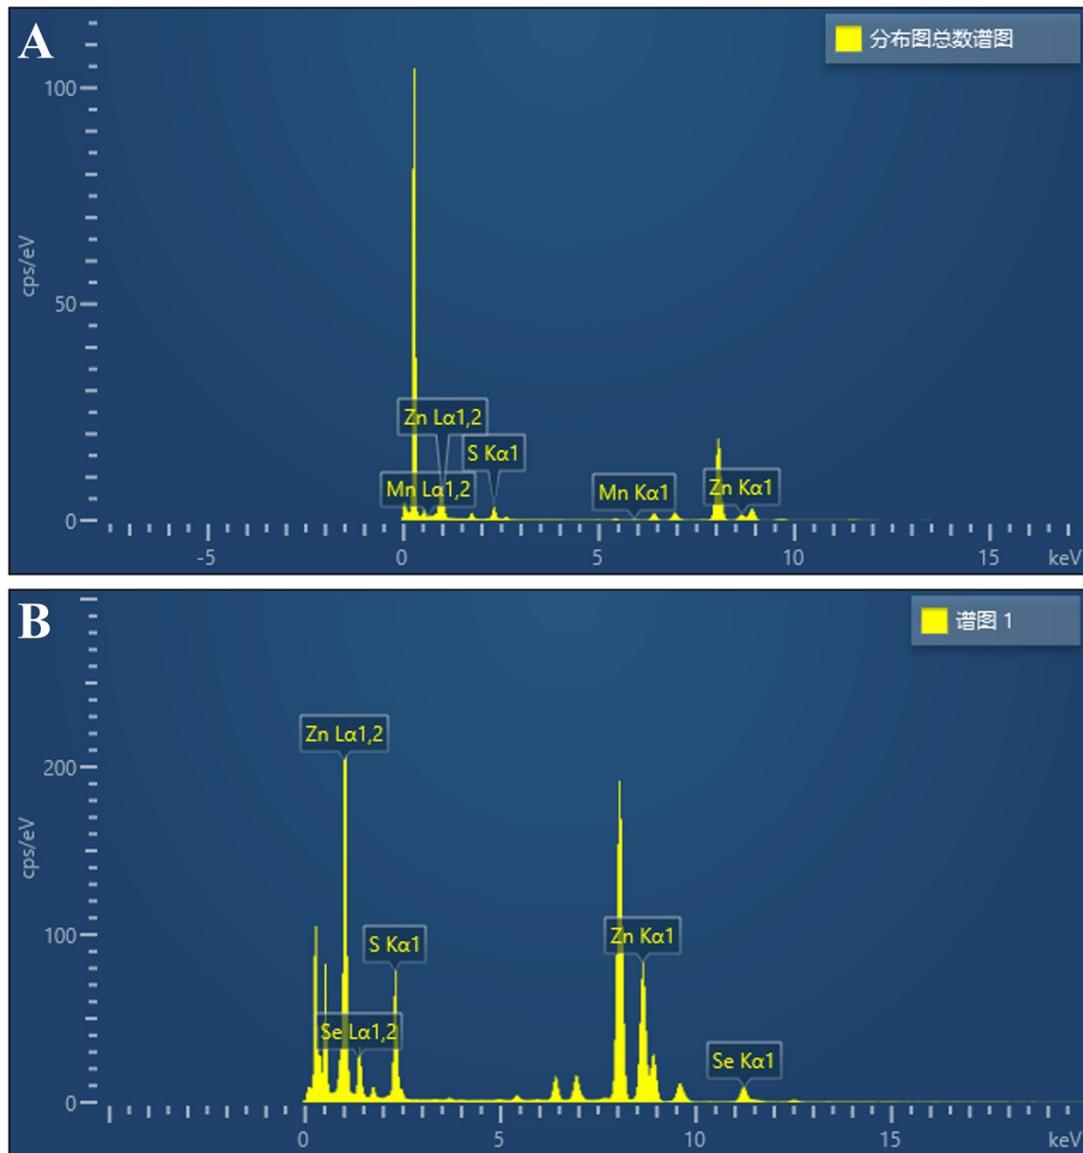

Fig.S1 The EDS spectra of oil-dispersible Mn:ZnS QDs (A) and ZnSe@ZnS QDs (B).

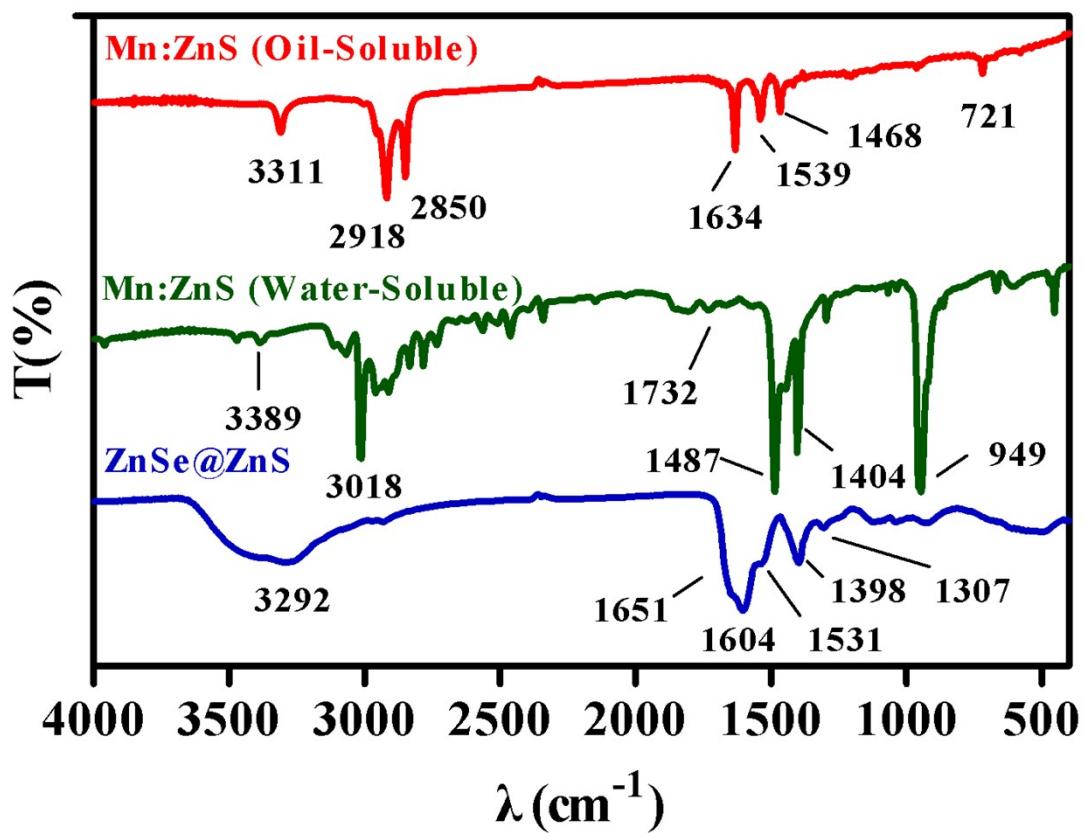

Fig.S2 The FTIR spectra of Mn:ZnS QDs and ZnSe@ZnS QDs.

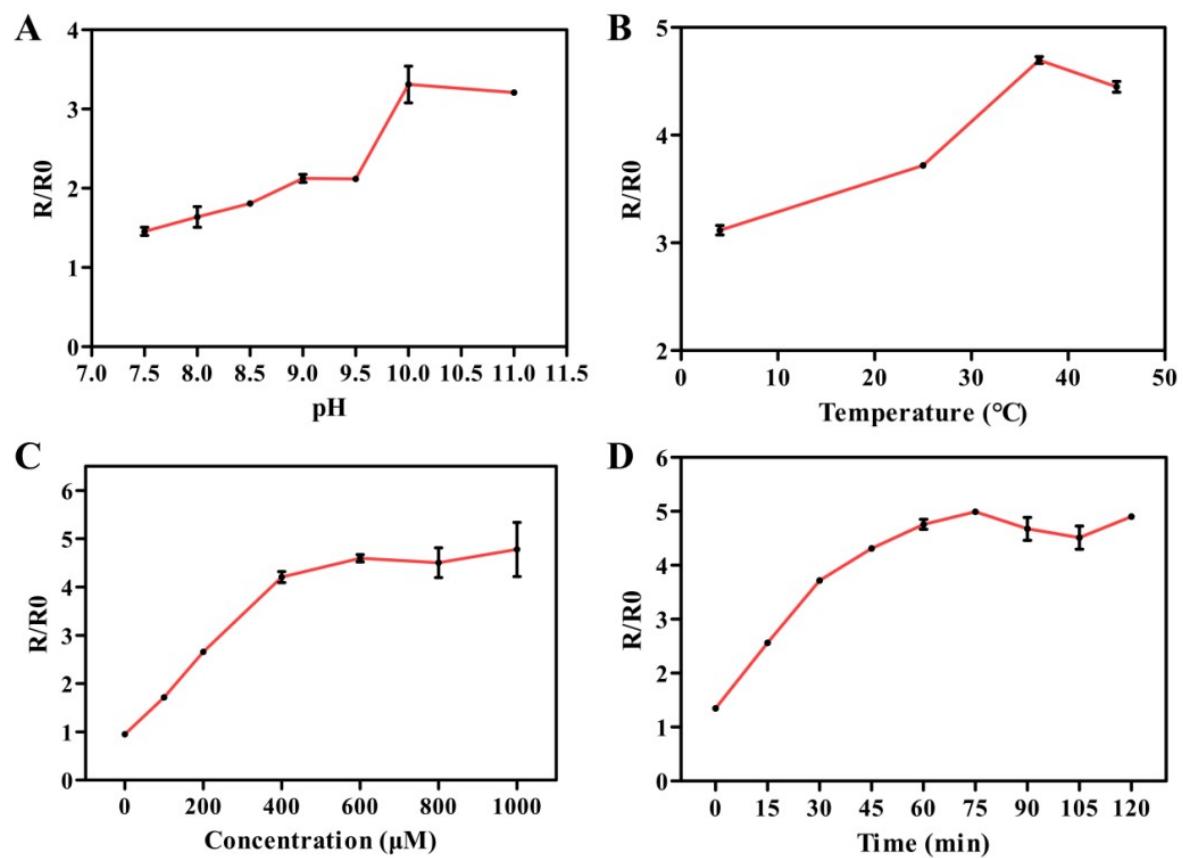

Fig.S3 The optimization of condition for ALP activity detection. The effects of pH of incubation buffer (A), temperature (B), concentration of PNPP in incubation buffer (C) and incubation time (D) on R/R₀ was investigated, respectively. R and R₀ are the values of F₅₈₅/F₄₀₅ in the presence and absence of ALP, respectively.

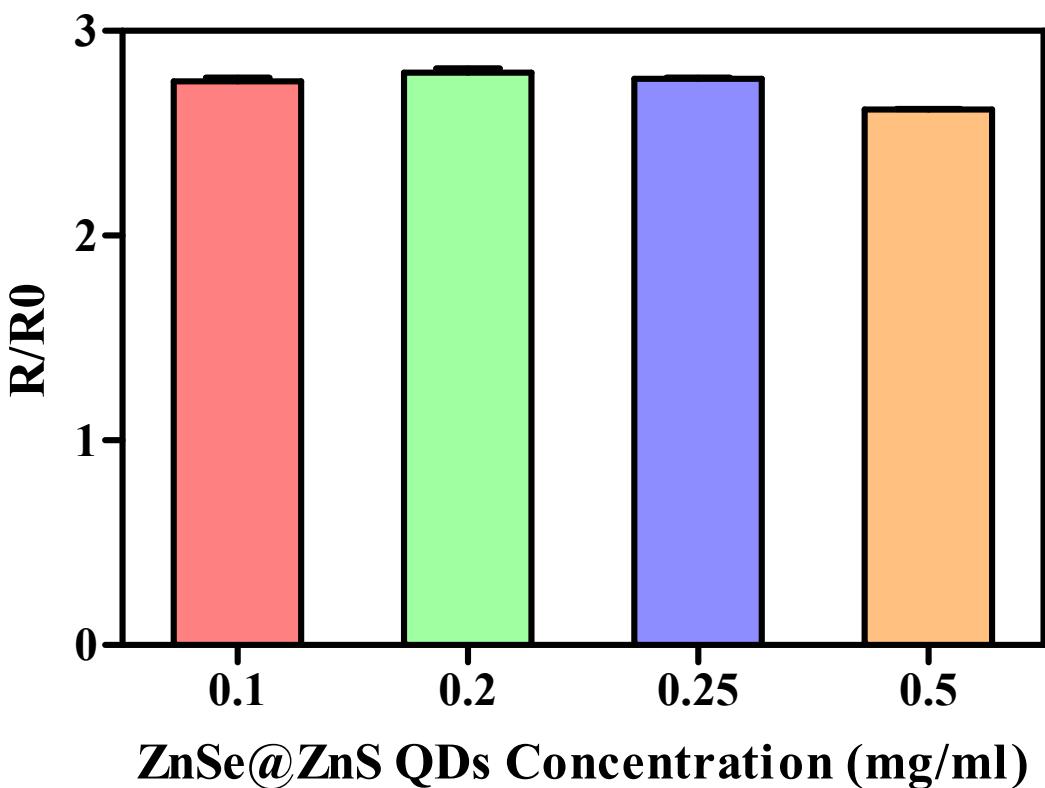

Fig.S4 The influence of the ratio of Mn:ZnS QDs to ZnSe@ZnS QDs on the detection signals. The concentration of Mn:ZnS QDs was fixed at 10 mg/ml while the concentration of ZnSe@ZnS QDs changed from 0.1 mg/ml to 0.5 mg/ml. The ALP activity of samples was set at 100 U/L. R and R₀ are the values of F585/F405 in the presence and absence of ALP, respectively.

Table S1. Calculation of fluorescence quantum yield of Mn:ZnS QDs
