## 1. General Considerations

All reactions involving air and moisture sensitive compounds were carried out using Schlenk line techniques or in a Vacuum Atmospheres OMNI-LAB glovebox under an oxygen free, N<sub>2</sub> atmosphere. Solvents used in air free reactions (toluene, hexanes, pentane, and tetrahydrofuran) were purchased from Fisher, sparged under ultrahigh purity (UHP) grade argon and passed through two columns of drying agent in a JCMeyer solvent purification system and dispensed directly into the glovebox. All other solvents were used without further purification. Deuterated NMR solvents, C<sub>6</sub>D<sub>6</sub>, CDCl<sub>3</sub>, and toluene-d<sub>8</sub> were purchased from Cambridge Isotope Laboratories and were used as received. Toluene-d<sub>8</sub> and C<sub>6</sub>D<sub>6</sub> suitable for air sensitive compounds were dried by stirring over Na/benzophenone for two days, followed by three freeze-pump-thaw cycles and vacuum transferred into a flame-dried Straus flask and stored in a glovebox under a N<sub>2</sub> atmosphere. Complexes {MeC(2,6-*i*Pr)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH}CHC(Me[N(2-OMeC<sub>6</sub>H<sub>4</sub>)])Y(CH<sub>2</sub>SiMe<sub>3</sub>)<sub>2</sub> (**6**),<sup>1</sup> {CH(CHC(Me[N(2-OMeC<sub>6</sub>H<sub>4</sub>)])Y(CH<sub>2</sub>SiMe<sub>3</sub>)<sub>2</sub>) (**7**)<sup>2</sup>, and {CH<sub>3</sub>C(2,6-*i*Pr)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH}CHC(CH<sub>3</sub>)(NCH<sub>2</sub>-NMe<sub>2</sub>)Y(CH<sub>2</sub>SiMe<sub>3</sub>)<sub>2</sub> (**8**)<sup>3</sup> and Y[N(SiMe<sub>3</sub>)<sub>2</sub>]<sub>3</sub><sup>4</sup> were synthesized following literature procedure. Isoprene, purchased from Sigma-Aldrich, was dried over 4Å molecular sieves for 7 days, followed by three freeze-pump-thaw cycles and a vacuum transfer into a flame-dried Straus flask and stored in a glovebox at -35 °C under a N<sub>2</sub> atmosphere. ε-Caprolactone, ε-decalactone, δ-valerolactone, and β-myrcene were purchased from Sigma-Aldrich and were dried over CaH<sub>2</sub> for 3 days followed by three freeze-pump-thaw cycles and a vacuum transfer to a flame-dried Straus flask and stored in a glovebox at -35 °C under a N<sub>2</sub> atmosphere. All other reagents and chemicals were obtained from commercial vendors (Sigma-Aldrich, TCI, Alfa Aesar, and VWR) and were used without further purification.

### 1.1 Polymerization Methods

#### *General procedure for the homopolymerization of 1,3-dienes or cyclic esters*

In a glovebox, catalyst **6-8** (10 μmol, 200 μL of a 0.5 M stock solution) was placed in a stir bar charged 20 mL vial and diluted in toluene (7 mL). Trityl (tetrakis(pentafluorophenyl)borate [Ph<sub>3</sub>C][B(C<sub>6</sub>F<sub>5</sub>)<sub>4</sub>] (10 μmol, 1 mL of a 0.01 M stock solution) was added to the vial and the mixture was stirred for 10 min. Olefin (300-800 equiv.) was added by micro syringe in one portion, and the polymerization was carried out for the designated time with constant stirring during which the reaction turned from orange to gold. The reaction mixture was poured into a large quantity of ethanol (100 mL) to give colorless copolymer that was dried in a vacuum oven at 40 °C for 12 h to a constant weight (0.90 g, 100%).

#### *General procedure for the block copolymerization of 1,3-dienes and cyclic esters*

In a glovebox, catalyst **6-8** (10 μmol, 200 μL of a 0.5 M stock solution) was placed in a stir bar charged 20 mL vial and diluted in toluene (7 mL). Trityl (tetrakis(pentafluorophenyl)borate [Ph<sub>3</sub>C][B(C<sub>6</sub>F<sub>5</sub>)<sub>4</sub>] (10 μmol, 1 mL of a 0.01 M stock solution) was added to the vial and reaction was stirred for 10 min. Olefin (300-800 equiv.) was added by micro syringe in one portion, and the polymerization was carried out for the designated time with constant stirring during which the reaction turned from orange to gold. Then cyclic ester (300-800 equiv.) was added by micro syringe to the above system and polymerization was continued for the designated time. The gel like reaction mixture was poured into a large quantity of ethanol (100 mL) to give colorless copolymer that was dried in a vacuum oven at 40 °C for 12 h to a constant weight (0.90 g, 100%).

*Note:* All conditions that deviate from this general procedure are clearly indicated in each table.

## 1.2 Characterization Methods

*NMR Spectroscopy.*  $^1\text{H}$ ,  $^{13}\text{C}$ , and  $^{19}\text{F}$  NMR spectra were recorded using a Varian Mercury 400 MHz, Varian 500 MHz, or Varian 600 MHz spectrometers. Chemical shifts are referenced to residual protons in the deuterated solvent or the deuterated solvent itself for  $^1\text{H}$  (7.26 ppm for  $\text{CDCl}_3$ , 2.08 for toluene- $\text{d}_8$ ) or  $^{13}\text{C}$  (77.16 ppm for  $\text{CDCl}_3$ ) NMR spectra. All NMR spectra were recorded at room temperature in specified deuterated solvents. Representative peak assignments shown for each homopolymer, isoprene,<sup>5,6</sup>  $\beta$ -myrcene,<sup>7</sup> Styrene,<sup>8</sup>  $\epsilon$ -caprolactone,<sup>8</sup>  $\delta$ -valerolactone,<sup>9</sup> and  $\epsilon$ -decalactone.<sup>10</sup>

*Fourier Transform Infrared Spectroscopy (FT-IR).* FT-IR spectra were recorded using an Agilent Cary 630 FT-IR equipped with a Diamond ATR sampling accessory. Accompanying MicroLab FT-IR software was used to acquire 72 scans at  $4\text{ cm}^{-1}$  resolution with a spectral range of  $400\text{--}4000\text{ cm}^{-1}$ .

*Gel Permeation Chromatography (GPC).* GPC analyses were conducted using an Agilent 1260 Infinity II GPC System equipped with a Wyatt DAWN HELEOS-II and a Wyatt Optilab T-rEX as well as an Agilent 1260 Infinity autosampler and UV-detector. The GPC system was equipped with an Agilent PolyPore column (5 micron, 4.6 mmID) which was calibrated using monodisperse polystyrene standards, eluted with THF at  $30\text{ }^\circ\text{C}$  at  $0.3\text{ mL/min}$ . The number average molar mass and dispersity values were determined from multi-angle light scattering (MALS) using  $dn/dc$  values calculated by 100 % mass recovery method from the refractive index (RI) signal.

*Thermal Gravimetric Analysis (TGA).* All TGA traces were recorded using Mettler-Toledo STARE System TGA/DSC 3+ equipped with STARE software, a TA SDTA Sensor LF, XP1 Balance, and a sample robot except for four samples (**S239-S242**). Data from these four samples were collected on a TGA Q50 instrument. Sample weight of purified polymer was between 5-15 mg was sealed in  $40\text{ }\mu\text{L}$  aluminum crucible fitted with a pierceable lid. General method involves heating from  $25\text{ }^\circ\text{C}$  to  $500\text{ }^\circ\text{C}$  at a scan rate of  $10\text{ }^\circ\text{C/min}$  under a constant flow of  $\text{N}_2$  ( $15\text{ mL/min}$ ).

*Differential Scanning Calorimetry (DSC).* DSC traces were recorded using a Perkin-Elmer DSC 8000 and processed with Pyris software. Sample weight of purified polymer was between 7-30 mg measured out on a microbalance and sealed in standard Perkin-Elmer Aluminum Pans. Data was collected at a consistent scan rate of  $10\text{ }^\circ\text{C/min}$  under a  $\text{N}_2$  flow of  $20\text{ mL/min}$ . General collection method involved 1) 5 min isothermal step at  $-80\text{ }^\circ\text{C}$ , 2) heating step from  $-80\text{ }^\circ\text{C}$  to  $100\text{ }^\circ\text{C}$ , 3) 5 min isothermal step, 4) cooling step from  $100\text{ }^\circ\text{C}$  to  $-80\text{ }^\circ\text{C}$ . These 4 steps were repeated through two additional heating and cooling cycles. All  $T_g$  and  $T_m$  values reported are from the 3<sup>rd</sup> heating scan. Any deviations from this method involved a temperature range shift.

## 1.6 Recycling PIP-*b*-PCL copolymers.

### General procedure for the degradation of PIP-*b*-PCL diblocks

In a 100 mL round bottom flask, charged with a stir bar, PIP-*b*-PCL 50:50 (0.2 g, 55 kDa) was dissolved in THF (~25 mL). A 2 M NaOH aqueous solution (50 mL) was then added, and the reaction flask was fitted with a reflux condenser and heated to 100 °C for 12 h. After cooling, the solution was neutralized with acetic acid. The organic fraction was separated, and the aqueous fraction was washed with THF (25 mL) 3 times. Organic fractions were combined and washed twice with 2 M NaHCO<sub>3</sub> (50 mL) followed by a brine wash (40 mL), dried over MgSO<sub>4</sub>, and filtered. The volatiles were evaporated *in vacuo* to afford a colorless gel. The residue was redissolved in toluene (5 mL) and colorless polymer was crashed out using cooled EtOH. Polymer was dried on a vacuum line at 45 °C for 3 days, then transferred to a high vacuum line for an additional day before being stored at -35 °C in a glovebox (75 mg, 63% mass loss).

### Formation of Alkoxide macroinitiator with recovered IP 50 and Y[N(SiMe<sub>3</sub>)<sub>2</sub>]<sub>3</sub> and repolymerization with CL

NMR scale PIP-*b*-PCL repolymerization was carried out in a J-young tube in toluene-*d*<sub>8</sub>. Initial <sup>1</sup>H NMR of the Y[N(SiMe<sub>3</sub>)<sub>2</sub>]<sub>3</sub> showed a singlet at 0.23 ppm corresponding to yttrium bound N(SiMe<sub>3</sub>)<sub>2</sub> (Fig. S2, bottom). Upon addition of PIP-OH 50 an immediate loss of the 0.23 ppm peak as well as formation of a new downfield HN(SiMe<sub>3</sub>)<sub>2</sub> peak was seen (Fig. S2, top). Subsequent addition of CL lead to immediate appearance of a peak at 3.92 ppm which corresponds to PCL (Fig. S3, middle). Full conversion of PCL was seen after 6 h (Fig. S3, top).

**Fig. S2.** <sup>1</sup>H NMR stack of Y[N(SiMe<sub>3</sub>)<sub>2</sub>]<sub>3</sub> before (bottom) and after recovered IP 50 addition (top) in toluene-*d*<sub>8</sub> at 298 K.

**Fig. S3.**  $^1\text{H}$  NMR stack of PIP-*b*-PCL repolymerization with  $\text{Y}[\text{N}(\text{SiMe}_3)_2]_3$  and PIP 50 in toluene- $\text{d}_8$  at 298 K. After macroinitiator formation (bottom), 20 min after CL addition (middle), and 6 h after CL addition (top).

*General procedure for the repolymerization of PIP-*b*-PCL diblocks*

In a glovebox, yttrium tris[N,N-bis(trimethylsilyl)amide] ( $\text{Y}[\text{N}(\text{SiMe}_3)_2]_3$ ) (1 equiv., 47  $\mu\text{L}$  of a 0.01 M stock solution, 0.47  $\mu\text{mol}$ ) was dissolved in toluene (2 mL) and transferred to a stir bar charged Schlenk flask. PIP-OH (2.5 equiv., 0.05 g, 43 kDa) was dissolved in toluene (5 mL) and slowly added. After stirring for 10 min,  $\epsilon$ -caprolactone (125 equiv., 8  $\mu\text{L}$ , 58  $\mu\text{mol}$ ) was added to the reaction. Reaction was removed from the glovebox and placed on a Schlenk line. The side arm of the Schlenk flask was evacuated and backfilled with dry  $\text{N}_2$  three times and the reaction mixture was heated to 70  $^\circ\text{C}$  for 6 h under  $\text{N}_2$  atmosphere. The colorless reaction mixture was poured into a large quantity of ethanol (50 mL) to quench the polymerization. The collected colorless polymer was dried in a vacuum oven at 40  $^\circ\text{C}$  for 12 h to a constant weight of 0.152 g.
