I. General Information

Chemicals and anhydrous solvents were purchased from commercial suppliers and used as received. Commercial unavailable substrates were synthesized according to literature (S-3tt, S-3vv). $^1$H NMR, $^{13}$C NMR, $^{19}$F NMR spectra were recorded on a Bruker AV-III400 (400 MHz) or AMX500 (500 MHz) spectrometer. Chemical shifts were calibrated using residual undeterated solvent as an internal reference (CDCl$_3$: 7.26 ppm $^1$H NMR, 77.16 ppm $^{13}$C NMR; DMSO-$d_6$: $^1$H NMR, 2.50 ppm $^{13}$C NMR 40.00 ppm). Multiplicity was indicated as follows: s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet), dd (doublet of doublet), brs (broad singlet). High-resolution mass spectra (HRMS) were obtained on a Finnigan/MAT 95XL-T spectrometer. GC analysis was performed on Aglilent 7820A & 5977E GC-MS. The Kessil PR160 series ($\lambda_{\text{max}}$ = 390 nm, 40 W) were used as the purple LED light source for the batch and continuous-flow reactions. All catalytic reactions were carried out in Schlenk tubes (20 mL) under an argon atmosphere with magnetic stirring after repeated freeze-pump-thaw. The isolated yield was the purified state by flash chromatography over silica gel.

\(^{(a)}\)Standard conditions: 1a (0.1 mmol), 2a (3 equiv), TBADT (2 mol%), CF\(_3\)COOH (30 mol%), H-Si(OCH\(_3\))\(_2\)CH\(_3\) (2.5 equiv.), CH\(_3\)CN (2mL), purple LEDs, 30°C, 24 h.

\(^{(b)}\)Conversions and yields based on the analysis of the \(^1\)H NMR spectra of the crude product mixture using CH\(_3\)Br\(_2\) as an internal standard.

**III. General Procedures for TBADT-Catalyzed Reductive Amidation**

**General procedure:**

A 20 mL Schlenk tube equipped with a magnetic stir bar was charged with TBADT (0.002 mmol, 6.6 mg), nitroarene 1 (0.1 mmol), aldehyde 2 (0.3 mmol), dimethoxy(methyl)silane (0.25 mmol, 31 μL) and trifluoroacetic acid (0.03 mmol, 2.5 μL). Then, 2.0 mL of anhydrous acetonitrile was added. The Schlenk tube was connected to Schlenk line and freeze-pump-thaw was performed for three times to completely remove air inside the reaction mixture. Eventually the Schlenk tube was refilled with an atmosphere of argon at room temperature and sealed. The reactor was irradiated by 2 sets of 390 nm Kessil lamps. Then the reaction was running at ambient temperature (~30 °C) using a fan to cool down the reaction mixture and stopped after 24 h. The reaction was quenched by the triethylamine and then remove the solvent under reduced pressure, the crude mixture was purified by silica gel column chromatography (eluent: hexane/diethyl ether or hexane/ethyl acetate; 10/1 – 1/1) to give the corresponding product 3.

\(^{(a)}\)Standard conditions: \( N \)-based intermediate (0.1 mmol), 2a (3 equiv.), TBADT (2 mol%), CF\(_3\)COOH (30 mol%), H-Si(OCH\(_3\))\(_2\)CH\(_3\) (2.5 equiv.), CH\(_3\)CN (2 mL), purple LEDs, 30°C, 24 h.

\(^{(b)}\)Conversions and yields based on analysis of the \(^1\)H NMR spectra of the crude product mixture using CH\(_3\)Br\(_2\) as an internal standard.

**Radical trapping experiments:**

A 20 mL Schlenk tube equipped with a magnetic stir bar was charged with TBADT (0.002 mmol, 6.6 mg), nitrobenzene (0.1 mmol, 10 \( \mu \)L), 4-Fluorobenzaldehyde (0.3 mmol, 32 \( \mu \)L), dimethoxy(methyl)silane (0.25 mmol, 31 \( \mu \)L), trifluoroacetic acid (0.03 mmol, 2.5 \( \mu \)L) and TEMPO (0.5 mmol, 78.1 mg). Then, 2.0 mL of anhydrous acetonitrile was added. The Schlenk tube was connected to Schlenk line and freeze-pump-thaw was performed for three times to completely remove air inside the reaction mixture. Eventually the Schlenk tube was refilled with an atmosphere of argon at room temperature and sealed. The reactor was irradiated by 2 sets of 390 nm Kessil lamps. Then the reaction was running at ambient temperature (~30 °C) using a fan to cool down the reaction mixture and stopped after 24 h. The reaction was quenched by the triethylamine and then remove the solvent under reduced pressure, the crude mixture was analyzed by ESI-MS.
**Supplementary Figure S1.** Trapping acyl radical by TEMPO.

**Detection of N-hydroxyamide.**

\[ \text{NO}_2 + H \rightarrow N \text{O}_\text{OH} \]

A 20 mL Schlenk tube equipped with a magnetic stir bar was charged with TBADT (0.002 mmol, 6.6 mg), nitrobenzene 1a (0.1 mmol, 10 μL), and aldehyde 2a (0.3 mmol, 25 μL), dimethoxy(methyl)silane (0.25 mmol, 31 μL) and trifluoroacetic acid (0.03 mmol, 2.5 μL). Then, 2.0 mL of anhydrous acetonitrile was added. The Schlenk tube was connected to Schlenk line and freeze-pump-thaw was performed for three times to completely remove air inside the reaction mixture. Eventually the Schlenk tube was refilled with an atmosphere of argon at room temperature and sealed. The reactor was irradiated by 2 sets of 390 nm Kessil lamps. Then the reaction was running at ambient temperature (~30 °C) using a fan to cool down the reaction mixture and stopped after 1 h. The reaction was quenched by the triethylamine and then remove the solvent under reduced pressure, the crude mixture was purified by silica gel column chromatography to give the N-hydroxyamide 6 in 60% yield.

<sup>(a)</sup>Standard conditions: 1a (0.1 mmol), 2a (3 equiv), TBA DT (2 mol%), CF<sub>3</sub>COOH (30 mol%), H-Si(OCH<sub>3</sub>)<sub>2</sub>CH<sub>3</sub> (2.5 equiv.), CH<sub>3</sub>CN (0.05 M), 2*40W LEDs (390 nm), 30 °C, 24 h.

<sup>(b)</sup>Conversions and yields based on analysis of the <sup>1</sup>H NMR spectra of the crude product mixture using CH<sub>3</sub>Br<sub>2</sub> as an internal standard.

Notably, without adding CF<sub>3</sub>COOH in the reaction (Table S6, entry 2), we isolate a major byproduct 9. The addition of CF<sub>3</sub>COOH improves the yield and inhibits side reaction between amide anion and aldehyde, demonstrating CF<sub>3</sub>COOH could accelerate the process and increase the reactivity.

Supplementary Figure S6. Detection of silanol by ESI-MS.
Time scale study

To examine the impact of light, we conducted experiments under alternating periods of irradiation and darkness (Figure S7-S8). These resulted in a total interruption of the reaction progress in the absence of light and recuperation of reactivity on further illumination, which allows precise temporal control over the entire reaction period. These results demonstrate that light is a necessary component of the reaction. Even though they do not definitively rule out a radical-chain process, the data show that any chain-propagation process must be short-lived.

Supplementary Figure S8. Time profile of the Conversion of Nitrobenzene with the light ON/OFF over time.
Cyclic Voltammetry data

Cyclic voltammetry (CV) was performed using a VersaSTAT 3 Potentiostat Galvanostat from Princeton Applied Research. A three-electrode setup was used, consisting of a glassy carbon working electrode, Pt wire counter electrode, and a Ag/AgCl reference electrode. Data were acquired in MeCN, with a scan rate of 100 mV/s, in the presence of Bu$_4$NPF$_6$ electrolyte (0.1 M), and reported with reference to Ag/AgCl. The samples were sparged with Argon for at least 5 minutes prior to data collection.

Calculation of redox potential of silyl radical

All DFT calculations were performed with the Gaussian 16 package. Geometry optimizations were performed for the reduced and oxidized forms of each molecule at B97D37-8 level of theory with the Def2QZVPP basis set by using CPCM solvation model (solvent = acetonitrile) under 298.15 K and 1 atm pressure. Frequency analysis was conducted at the same level of theory to verify the stationary points with no imaginary frequencies. The solution phase electrochemical redox potentials are calculated based on \( \text{eq. S1}. \)

\[
E_{1/2}^{\text{calc}} = - \frac{G_{298}[\text{reduced}] - G_{298}[\text{oxidized}]}{n_e F} - E_{1/2}^{\text{SHE}} + E_{1/2}^{\text{SCE}}
\]  

\( n_e \), The number of electrons transferred  
\( F = 23.061 \text{ kcal mol}^{-1} \text{ V}^{-1} \), Faraday constant  
\( E_{1/2}^{\text{SHE}} = 4.281 \text{ V} \), Absolute value for the standard hydrogen electrode (SHE)  
\( E_{1/2}^{\text{SCE}} = -0.141 \text{ V} \), the potential of saturated calomel electrode (SCE) relative to SHE in acetonitrile  
\( G_{298}[\text{reduced}] \) and \( G_{298}[\text{oxidized}] \) are the Gibbs free energies in acetonitrile as gathered from DFT calculations.

Determination of Quantum Yield

Determination of light intensity at 390 nm:
the photon flux of the spectrophotometer was determined by standard ferrioxalate actinometry. A 0.15 M solution of ferrioxalate was prepared by dissolving 2.21 g of potassium ferrioxalate hydrate in 30 mL of 0.05 M H₂SO₄. A buffered solution of phenanthroline was prepared by dissolving 50 mg of phenanthroline and 11.25 g of sodium acetate in 50 mL of 0.5 M H₂SO₄. Both solutions were stored in the dark. To determine the photon flux of the spectrophotometer, 2.0 mL of the ferrioxalate solution was placed in a cuvette and irradiated for 90.0 seconds at λ = 390 nm with an emission slit width at 10.0 nm. After irradiation, 0.35 mL of the phenanthroline solution was added to the cuvette. The solution was then allowed to rest for 1 h to allow the ferrous ions to completely coordinate to the phenanthroline. The absorbance of the solution was measured at 510 nm. A non-irradiated sample was also prepared and the absorbance at 510 nm measured.
Conversion was calculated using eq. S2.

\[
\text{eq. S2} \quad \text{mol Fe}^{2+} = \frac{V \times \Delta A}{l \times \varepsilon} \quad \text{mol Fe}^{2+} = \frac{V \times \Delta A}{l \times \varepsilon}
\]

\[
\text{mol Fe}^{2+} = \frac{V \times \Delta A}{l \times \varepsilon} = \frac{0.00235 L \times 0.052}{1 \text{ cm} \times 11100 \text{ L/mol cm}} = 2.23 \times 10^{-7} \text{ mol}
\]

Where V is the total volume (0.00235 L) of the solution after addition of phenanthroline, \( \Delta A \) is the difference in absorbance at 510 nm between the irradiated and non-irradiated solutions, l is the path and \( \varepsilon \) is the molar absorptivity at 510 nm (11100 L/mol cm⁻¹).

The photon flux can be calculated using eq. S3.

\[
\text{eq S3} \quad \text{Photon flux} = \frac{\text{mol Fe}^{2+}}{\Phi \times t \times f} \quad \text{mol Fe}^{2+}
\]

\[
\text{Photon flux} = \frac{\text{mol Fe}^{2+}}{\Phi \times t \times f} = \frac{2.23 \times 10^{-7} \text{ mol}}{1.13 \times 90.0 \times 0.1} = 2.19 \times 10^{-9} \text{ Einstein s}^{-1}
\]

Where \( \Phi \) is the quantum yield for the ferrioxalate actinometer (1.13 for 0.15 M solution at λ = 390 nm), t is the time (90.0 s), and f is the fraction of light absorbed at λ = 390 nm (1.0). The photon flux was calculated (average of three experiments) to be 2.19 \times 10^{-9} \text{ einstein s}^{-1}.
Determination of quantum yield of Reductive amidation of nitrobenzene:

A cuvette was charged with nitrobenzene (10 uL, 0.1 mmol), Cyclopropanecarboxaldehyde (24 uL, 0.3 mmol), TBADT (6.6 mg, 0.002 mmol), dimethoxy(methyl)silane (31 uL, 0.25 mmol) and TFA (1.5 uL, 0.03 mmol) in anhydrous acetonitrile (2 mL). The cuvette was then capped with a PTFE stopper. The sample was stirred and irradiated (λ = 390 nm) for 21600 s (3 h). After irradiation, the solvent was removed. The yield of product formed was determined as 11% by crude $^1$H NMR based on a dibromomethane standard. The quantum yield was determined using eq. S4.

**Eq. S4**

$\Phi (11\%) = \frac{\text{mol product}}{\text{flux} \times t} = 0.46$

$\Phi (11\%) = 0.46$.

**Kinetic Isotope Effect study.**

We conducted the KIE experiments with initial rates, and the KIEs were determined from two parallel reactions for 6 h, giving $K_H/K_D = 1.13$. These results suggested that aldehydic C($sp^2$)-H activation might not be involved in the rate-determining step.

**Supplementary Figure S13.** Kinetic Isotope Effect measured from two parallel reactions.
Proposed mechanisms

Redox potentials of photocatalyst TBADT (E_{1/2}^{\text{red}} ([W_{10}O_{32}]^{5-}/[W_{10}O_{32}]^{4-}) = -1.27 V vs Ag/Ag⁺ in acetonitrile) and hydroxyamide (E_{\text{red}} = -0.65 V vs Ag/Ag⁺ in acetonitrile) using cyclic voltommetry (CV) measurements have been obtained and the KIE study (K_H/K_D = 1.13) and quantum yield calculation (Φ=0.46) has been conducted. Carboxylic acids as byproducts are detected by ¹H-NMR and silanols or silyl ethers are also detected by ESI-MS.

Based on the experimental data and previous literature, a more detailed mechanism is proposed as shown below (Figure S14). The excited photocatalyst TBADT abstracts a hydrogen atom from aldehydes or silanes to generate the corresponding acyl radicals or silyl radicals and H⁺[W_{10}O_{32}]^{5-}. The acyl radicals could directly undergo a radical addition on nitroarenes to give the intermediates I, followed by decomposition to offer nitrosoarenes and carboxyl radicals II. This carboxyl radical species II is capable of abstracting another hydrogen atom from aldehydes to deliver acyl radicals. Then nitrosobenzene will react with acyl radicals to form radical species III, followed by a SET process with H⁺[W_{10}O_{32}]^{5-} to give rise to the N-hydroxy amide. The highly reductive species H⁺[W_{10}O_{32}]^{5-} (E_{1/2}^{\text{red}} ([W_{10}O_{32}]^{4-}/[W_{10}O_{32}]^{5-}) = -1.27V vs Ag/Ag⁺ in acetonitrile) can also reduce the hydroxyamide (E_{\text{red}} = -0.65 V vs Ag/Ag⁺ in acetonitrile) to the corresponding radical anion intermediate VI, which will release OH⁻ to generate amidyl radical VII followed by another SET with H⁺[W_{10}O_{32}]^{5-} to give the amide anion VIII. Then the amide anion (VIII) undergoes protonation to accomplish the amide product. The addition of trifluoroacetic acid (TFA) improves the product yield and inhibits side reaction between amide anion VIII and aldehyde. We speculated TFA could accelerate the protonation step (see Table S6). In this reductive amidation, silanes are used as the reductant to improve the yield, however, it’s not essential. In fact, silanes can be replaced by an excess amount of aldehydes (Table S7). To accomplish the catalytic cycle, at least 2.0 equiv of reductants were required, which were consistent with our experimental results. The in situ generated silyl radical may undergo a single electron oxidation by the excited *[W_{10}O_{32}]^{4-} (E ~ + 2.5 V vs SCE in MeCN) to furnish a silyl cation intermediate, which is captured by nucleophiles such as H₂O and silanols to give silanols or silyl ethers as byproducts after deprotonation. Density functional theory (DFT) calculations support a SET step from the silyl radical to silyl cation, as the reductive potential of dimethoxy-(methyl)silyl radical is calculated to be -0.52 V versus SCE in MeCN (Table S8). The detection of the silane byproducts silanols or silyl ethers also supported this process (Figures S5-S6).
Supplementary Figure S14. Proposed mechanisms of the reductive amidation.

As for the mechanism details of the reduction of N-hydroxy amide, when TBADT is not used, there is still 68% conversion of N-hydroxy amide using 2.5 equiv of hydrosilanes and 3 equiv of aldehydes as the reductants under 390 nm light irradiation after 24 h (Table S7, entry 5), indicating that N-hydroxy amide could be directly reduced by the reductants silanes or aldehydes. Without light irradiation, the reduction of N-hydroxyamide barely occurred although 2.5 equiv of hydrosilanes was added (entry 6). Without any reductant, only light irradiation could not efficiently promote the reduction (entry 7). These control experiments indicated the importance of both light and reductants. Furthermore, the UV-Vis experiment shows N-hydroxy amide has a weak absorbance at 390 nm (Figure S3). A relevant report revealed that N-hydroxy amide could undergo homolytic cleavage under photo-irradiation conditions. This may explain why without TBADT, the N-hydroxy amide could still be reduced to the amide under 390 nm light irradiation in the presence of reductants such as silanes or aldehydes (Figure S15). However, in the presence of TBADT, it only consititutes a minor pathway to the final amide product.
Supplementary Figure S15. Proposed mechanisms of reduction of $N$-hydroxyamide without TBADT.
V. Scale Up in Continuous-Flow Reactors

Images of flow reactors are shown in Figure S17. Back pressure regulators (BPRs), high-purity perfluoroalkoxy polymer (HPFA) tubing, fittings were purchased from IDEX Health & Science Technologies. The Asia syringe pump was purchased from Syrris Ltd. Selection valves were purchased from Valco Instruments Co. Inc.

Supplementary Figure S16. The reaction scale-up in continuous-flow reactors.

Flow reactor setup

Supplementary Figure S17. The flow apparatus. A. The flow tubing on a stainless steel container. B. The flow set-up with light irradiation.

Reductive amidation in flow

Inside a glove-box, nitrobenzene 1a (4 mL, 40 mmol), 7-hydroxy-3,7-dimethyloctanal 2j (120 mmol, 22.4 mL), TBADT (0.8mmol, 2.7g) dimethoxy(methyl)silane (100 mmol, 12.4 mL) and trifluoroacetic acid (1 mL, 12 mmol) were added to a 1 L round bottom flask. The reagents were dissolved in degassed acetonitrile and the total volume of the solution was adjusted to 800 mL. The reaction solution was introduced to the flow apparatus (Figure S17). The flow apparatus was purged with degassed acetonitrile to remove the air first. An Asian pump was then connected to the reaction mixture and the tubing with 5 psi back-pressure regulator (BPR). The HPFA (high purity
perfluoroalkoxyalkane) tubing (O.D. = 1/8 inch, I.D. = 0.062 inch, length = 29.8 m, volume = 56 mL) was rounded on a stainless steel container (O.D. = 10 cm). The tubing was then irradiated by six sets of 390 nm Kessil lamps (the light intensity for each was set 40 W). The flow apparatus was cooled by two fans, keeping the ambient temperature around 30-34 °C. The flow apparatus itself was set up with residence time (Tr) = 40 min, flow rate = 1.4 mL/min. After 80 min of equilibration, the product mixture was collected for 8h. A crude sample (5.6 mL) was taken from the collected solution and analyzed by 1H NMR spectroscopy using CH2Br2 (14 μL, 0.2 mmol) as an internal standard. Full conversion of nitrobenzene (1a) was observed and the 1H NMR yield of product 3j was 75%. The crude NMR sample was recovered and combined with the reaction mixture. The combined crude was concentrated and purified by column chromatography to give product 3j (6.3 g) in 71% yield.
VI. Characterization Data of Products

**N-phenylcyclopropanecarboxamide (3a).** Following the general procedure, the title compound (12.6 mg) was obtained in 78%. $^1$H NMR (400 MHz, Chloroform-$d$) $\delta$ 7.51 (d, $J = 7.9$ Hz, 2H), 7.32 (q, $J = 9.2$, 7.9 Hz, 2H), 7.09 (t, $J = 7.4$ Hz, 1H), 1.50 (s, 1H), 1.10 – 1.07 (m, 2H), 0.87 – 0.83 (m, 2H). $^{13}$C NMR (100 MHz, DMSO-$d_6$) $\delta$ 172.1, 139.9, 129.2, 123.4, 119.5, 15.0, 7.6. HRMS ESI [M+H]$^+$ Calculated for C$_{10}$H$_{12}$NO 162.0919, found 162.0917.

**N-phenylisobutyramide (3b).** Following the general procedure, the title compound (10.3 mg) was obtained in 63%. $^1$H NMR (400 MHz, Chloroform-$d$) $\delta$ 7.53 (d, $J = 9.7$ Hz, 2H), 7.37 – 7.27 (m, 2H), 7.11 (d, $J = 6.2$ Hz, 2H), 2.51 (p, $J = 6.9$ Hz, 1H), 1.26 (d, $J = 6.9$ Hz, 6H). $^{13}$C NMR (100 MHz, Chloroform-$d$) $\delta$ 175.0, 137.3, 129.0, 124.1, 119.7, 36.8, 19.6. HRMS ESI [M+H]$^+$ Calculated for C$_{10}$H$_{14}$NO 164.1075, found 164.1078.

**2-ethyl-N-phenylhexanamide (3c).** Following the general procedure, the title compound (18.9 mg) was obtained in 65%. $^1$H NMR (400 MHz, DMSO-$d_6$) $\delta$ 9.97 (s, 1H), 7.64 (d, $J = 8.0$ Hz, 2H), 7.27 (dd, $J = 8.5$, 7.4 Hz, 2H), 7.16 – 6.96 (m, 1H), 2.32 (tt, $J = 9.5$, 5.2 Hz, 1H), 1.70 – 1.48 (m, 2H), 1.47 – 1.29 (m, 2H), 1.26 (d, $J = 8.6$ Hz, 4H), 0.84 (td, $J = 7.3$, 2.2 Hz, 6H). $^{13}$C NMR (100 MHz, DMSO-$d_6$) $\delta$ 175.1, 140.2, 129.0, 123.4, 119.7, 52.5, 32.4, 29.8, 26.2, 14.4, 12.3, 7.7. HRMS ESI [M+H]$^+$ Calculated for C$_{14}$H$_{22}$NO 220.1701, found 220.1701.

**N-phenylcyclohexanecarboxamide (3d).** Following the general procedure, the title compound (14.8 mg) was obtained in 73%. $^1$H NMR (400 MHz, DMSO-$d_6$) $\delta$ 9.80 (s, 1H), 7.88 – 7.53 (m, 2H), 7.44 – 7.20 (m, 2H), 7.06 – 6.84 (m, 1H), 2.33 (tt, $J = 11.7$, 3.4 Hz, 1H), 1.77 (ddt, $J = 18.2$, 15.0, 3.0 Hz, 4H), 1.70 – 1.59 (m, 1H), 1.42 (qd, $J = 12.2$, 2.7 Hz, 2H), 1.37 – 1.15 (m, 3H). $^{13}$C NMR (100 MHz, DMSO-$d_6$) $\delta$ 179.6, 144.8, 133.8, 128.0, 124.3, 50.1, 34.4, 30.6, 30.5. HRMS ESI [M+H]$^+$ Calculated for C$_{13}$H$_{18}$NO 204.1388, found 204.1386.
**N-phenyltetrahydro-2H-pyran-4-carboxamide (3e).** Following the general procedure, the title compound (12.5 mg) was obtained in 61%. $^1\text{H NMR}$ (400 MHz, DMSO-$d_6$) δ 9.86 (s, 1H), 7.76 – 7.50 (m, 2H), 7.46 – 7.19 (m, 2H), 7.10 – 6.74 (m, 1H), 4.05 – 3.84 (m, 2H), 3.44 – 3.34 (m, 2H), 2.58 (tt, $J = 10.4, 5.4$ Hz, 1H), 1.70 – 1.63 (m, 4H). $^{13}\text{C NMR}$ (100 MHz, Chloroform-$d$) δ 172.4, 129.0, 124.3, 119.8, 119.0, 71.1, 37.2, 29.2. HRMS ESI [M+H]$^+$ Calculated for C$_{12}$H$_{16}$NO$_2$ 206.1181, found 206.1184.

**N-phenylacetamide (3f).** Following the general procedure but adding 20 equivalent aldehyde, the title compound (12.5 mg) was obtained in 60%. $^1\text{H NMR}$ (400 MHz, Chloroform-$d$) δ 7.49 (d, $J = 7.4$ Hz, 2H), 7.32 (t, $J = 7.9$ Hz, 2H), 7.23 (s, 1H), 7.10 (t, $J = 7.4$ Hz, 1H), 2.18 (s, 3H). $^{13}\text{C NMR}$ (100 MHz, DMSO-$d_6$) δ 168.8, 139.8, 129.1, 123.4, 119.5, 24.5. HRMS ESI [M+H]$^+$ Calculated for C$_8$H$_{10}$NO 136.0762, found 136.0761.

**N-phenylhexanamide (3g).** Following the general procedure, the title compound (15.5 mg) was obtained in 81%. $^1\text{H NMR}$ (400 MHz, Chloroform-$d$) δ 7.51 (d, $J = 7.9$ Hz, 2H), 7.37 – 7.28 (m, 2H), 7.15 – 7.05 (m, 2H), 2.35 (t, $J = 7.6$ Hz, 2H), 1.73 (q, $J = 7.4$ Hz, 2H), 1.36 (h, $J = 3.8$ Hz, 4H), 1.07 – 0.79 (m, 3H). $^{13}\text{C NMR}$ (100 MHz, DMSO-$d_6$) δ 172.0, 140.0, 129.0, 123.3, 119.5, 36.8, 31.4, 25.4, 22.4, 14.4. HRMS ESI [M+H]$^+$ Calculated for C$_{12}$H$_{18}$NO 192.1388, found 192.1390.

**3-methyl-N-phenylbutanamide (3h).** Following the general procedure, the title compound (12.3 mg) was obtained in 70%. $^1\text{H NMR}$ (400 MHz, Chloroform-$d$) δ 7.59 – 7.46 (m, 2H), 7.41 – 7.28 (m, 2H), 7.10 (t, $J = 7.4$ Hz, 2H), 2.24 – 2.20 (m, 3H), 1.03 – 1.01 (m, 6H). $^{13}\text{C NMR}$ (126 MHz, DMSO-$d_6$) δ 171.2, 139.7, 129.1, 123.5, 119.6, 46.1, 26.1, 22.7. HRMS ESI [M+H]$^+$ Calculated for C$_{11}$H$_{16}$NO 178.1232, found 178.1235.
**N,2-diphenylacetamide (3i).** Following the general procedure, the title compound (11.6 mg) was obtained in 55%. $^1$H NMR (400 MHz, DMSO-$d_6$) $\delta$ 10.52 (s, 1H), 8.01 – 7.44 (m, 2H), 7.49 – 7.16 (m, 7H), 7.16 – 6.71 (m, 1H), 3.68 (s, 2H). $^{13}$C NMR (100 MHz, DMSO-$d_6$) $\delta$ 169.7, 139.9, 136.7, 129.6, 129.1, 128.7, 127.0, 123.6, 119.6, 45.8. HRMS ESI $[M+H]^+$ Calculated for C$_{14}$H$_{14}$NO 212.1075, found 212.1077.

![N,2-diphenylacetamide (3i)](image)

**7-hydroxy-3,7-dimethyl-N-phenyloctanamide (3j).** Following the general procedure, the title compound (20.5 mg) was obtained in 78%. $^1$H NMR (400 MHz, Chloroform-$d$) $\delta$ 7.51 (d, $J = 8.0$ Hz, 2H), 7.32 (t, $J = 7.9$ Hz, 2H), 7.17 (s, 1H), 7.10 (t, $J = 7.4$ Hz, 1H), 2.25 – 2.01 (m, 3H), 1.99-1.94 (m, 2H), 1.40 – 1.35 (m, 2H), 1.26 – 1.25 (m, 2H), 1.21 (s, 6H), 1.01 (d, $J = 6.3$ Hz, 3H). $^{13}$C NMR (126 MHz, Chloroform-$d$) $\delta$ 170.5, 130.9, 129.0, 124.2, 119.8, 68.2, 45.5, 43.8, 37.2, 29.4, 29.1, 21.6, 19.8. HRMS ESI $[M+H]^+$ Calculated for C$_{16}$H$_{26}$NO$_2$ 264.1964, found 264.1963.

![7-hydroxy-3,7-dimethyl-N-phenyloctanamide (3j)](image)

**N-phenylbenzamide (3k).** Following the general procedure, the title compound (11.8 mg) was obtained in 60%. $^1$H NMR (400 MHz, DMSO-$d_6$) $\delta$ 10.29 (s, 1H), 8.01 – 7.97 (m, 2H), 7.85 – 7.81 (m, 2H), 7.62 – 7.51 (m, 3H), 7.39 – 7.34 (m, 2H), 7.14 – 7.09 (m, 1H). $^{13}$C NMR (126 MHz, DMSO-$d_6$) $\delta$ 166.1, 139.7, 135.5, 132.0, 129.1, 128.8, 128.1, 124.1, 120.9. HRMS ESI $[M+H]^+$ Calculated for C$_{13}$H$_{12}$NO 198.0919, found 198.0916.

![N-phenylbenzamide (3k)](image)

**4-fluoro-N-phenylbenzamide (3l).** Following the general procedure, the title compound (15.2 mg) was obtained in 71%. $^1$H NMR (400 MHz, Chloroform-$d$) $\delta$ 7.91 – 7.87 (m, 2H), 7.72 (s, 1H), 7.64 – 7.61 (m, 2H), 7.41 – 7.36 (m, 2H), 7.20 – 7.15 (m, 3H). $^{13}$C NMR (100 MHz, Chloroform-$d$) $\delta$ 166.1, 163.9 (d, $J = 9$ Hz), 137.2, 129.8, 129.6, 129.0, 124.1, 120.2, 116.6, 115.4. HRMS ESI $[M+H]^+$ Calculated for C$_{13}$H$_{11}$FNO 216.0825 found 216.0826.

![4-fluoro-N-phenylbenzamide (3l)](image)
4-chloro-N-phenylbenzamide (3m). Following the general procedure, the title compound (14.3 mg) was obtained in 62%. $^1$H NMR (400 MHz, DMSO-$d_6$) δ 10.33 (s, 1H), 8.00 – 7.97 (m, 2H), 7.78 – 7.75 (m, 2H), 7.72 – 7.60 (m, 2H), 7.37 – 7.33 (m, 2H), 7.13 – 7.09 (m, 1H). $^{13}$C NMR (126 MHz, DMSO-$d_6$) δ 164.9, 139.4, 136.9, 134.1, 130.1, 129.1, 128.9, 124.3, 120.9. HRMS ESI [M+H]$^+$ Calculated for C$_{13}$H$_{11}$ClNO 232.0529 found 232.0531.

4-bromo-N-phenylbenzamide (3n). Following the general procedure, the title compound (14.8 mg) was obtained in 54%. $^1$H NMR (400 MHz, Chloroform-$d$) δ 7.76 – 7.73 (m, 3H), 7.65 – 7.61 (m, 4H), 7.41 – 7.36 (m, 2H), 7.19 – 7.15 (m, 1H). $^{13}$C NMR (126 MHz, Chloroform-$d$) δ 164.3, 138.1, 133.0, 131.3, 129.9, 129.0, 125.4, 124.1, 119.7. HRMS ESI [M+H]$^+$ Calculated for C$_{13}$H$_{11}$BrNO 276.0024 found 276.0021.

4-iodo-N-phenylbenzamide (3o). Following the general procedure, the title compound (6.4 mg) was obtained in 20%. $^1$H NMR (400 MHz, DMSO-$d_6$) δ 10.29 (s, 1H), 7.92 (d, $J = 8.5$ Hz, 2H), 7.78 – 7.73 (m, 3H), 7.37 – 7.33 (m, 2H), 7.13 – 7.08 (m, 1H). $^{13}$C NMR (126 MHz, DMSO-$d_6$) δ 164.9, 141.1, 138.7, 131.6, 128.4, 128.1, 127.2, 123.1, 119.9. HRMS ESI [M+H]$^+$ Calculated for C$_{13}$H$_{11}$I NO 323.9885 found 323.9887.

4-cyano-N-phenylbenzamide (3p). Following the general procedure, the title compound (13.3 mg) was obtained in 60%. $^1$H NMR (400 MHz, Chloroform-$d$) δ 7.98 (d, $J = 8.4$ Hz, 2H), 7.82 – 7.78 (m, 3H), 7.64 – 7.62 (m, 2H), 7.42 – 7.38 (m, 2H), 7.22 – 7.18 (m, 1H). $^{13}$C NMR (126 MHz, DMSO-$d_6$) δ 167.5, 139.9, 131.9, 130.1, 129.1, 127.5, 123.9, 120.9, 114.3, 114.1. HRMS ESI [M+H]$^+$ Calculated for C$_{14}$H$_{11}$N$_2$O 223.0871 found 223.0872.

3-cyano-N-phenylbenzamide (3q). Following the general procedure, the title compound (9.3 mg) was obtained in 42%. $^1$H NMR (400 MHz, DMSO-$d_6$) δ 10.58 (s, 1H), 8.46 (d, $J = 1.9$ Hz, 1H), 8.31 (dt, $J = 7.9$, 1.6 Hz, 1H), 8.06 (dd, $J = 7.8$, 1.4 Hz, 1H), 7.84 – 7.81 (m, 2H), 7.75 (t,
$J = 7.8$ Hz, 1H), 7.37 (t, $J = 7.8$ Hz, 2H), 7.15 – 7.11 (m, 1H). $^{13}$C NMR (126 MHz, DMSO-$d_6$) δ 164.1, 139.3, 136.4, 135.4, 133.1, 131.9, 130.3, 129.1, 124.5, 121.0, 118.8, 112.0. HRMS ESI [M+H]$^+$ Calculated for C$_{14}$H$_{11}$N$_2$O 223.0871 found 223.0873.

**N-phenyl-4-(trifluoromethyl)benzamide (3r).** Following the general procedure, the title compound (16.7 mg) was obtained in 63%. $^1$H NMR (400 MHz, Chloroform-$d$) δ 7.99 (d, $J = 8.1$ Hz, 2H), 7.78 – 7.76 (m, 3H), 7.64 (d, $J = 7.6$ Hz, 2H), 7.40 (dd, $J = 8.5$, 7.4 Hz, 2H), 7.22 – 7.17 (m, 1H). $^{13}$C NMR (126 MHz, DMSO-$d_6$) δ 164.9, 139.3, 131.8 (q, $J = 18.75$ Hz), 129.2, 129.1, 125.9, 124.5, 124.4 (q, $J = 270$ Hz), 120.9. HRMS ESI [M+H]$^+$ Calculated for C$_{14}$H$_{11}$F$_3$NO 266.0793 found 266.0791.

**4-methyl-N-phenylbenzamide (3s).** Following the general procedure, the title compound (9.5 mg) was obtained in 45%. $^1$H NMR (400 MHz, Chloroform-$d$) δ 7.79 – 7.76 (m, 2H), 7.64 (d, $J = 7.4$ Hz, 2H), 7.37 (dd, $J = 8.5$, 7.4 Hz, 2H), 7.29 (d, $J = 7.7$ Hz, 2H), 7.17 – 7.12 (m, 1H), 2.43 (s, 3H). $^{13}$C NMR (126 MHz, DMSO-$d_6$) δ 165.8, 142.0, 139.7, 132.6, 129.37, 129.0, 128.2, 124.0, 120.8, 21.5.
