Materials and Methods

General

All chemicals and solvents (ACS or HPLC grade) were commercially available and used as received unless otherwise indicated. For all air-sensitive reactions and electrochemical experiments, HPLC-grade solvents were obtained as anhydrous and air-free from a PPT Glass Contour Solvent Purification System. Gas cylinders were obtained from Praxair (Ar as 5.0; CO₂ as 4.0) and passed through activated molecular sieves prior to use. Gas mixing for variable concentration experiments was accomplished using a gas proportioning rotameter from Omega Engineering. UV-vis absorbance spectra were obtained on a Cary 60 from Agilent. An Anton-Parr Multiwave Pro SOLV, NXF-8 microwave reactor was used for microwave syntheses.

Electrochemistry

All electroanalytical experiments were performed using a Metrohm Autolab PGSTAT302N potentiostat. Glassy carbon working ($\emptyset = 3$ mm) and non-aqueous silver/silver chloride pseudoreference electrodes behind PTFE tips were obtained from CH Instruments. The pseudoreference electrodes were obtained by depositing chloride on bare silver wire in 10% HCl at oxidizing potentials and stored in a 0.1 M tetrabutylammonium hexafluorophosphate/*N*,*N*-dimethylformamide (*N*,*N*-DMF) solution in the dark prior to use. The counter electrode was a glassy carbon rod ($\emptyset = 3$ mm). All CV experiments were performed in a modified scintillation vial (20 mL volume) as a single-chamber cell with a cap modified with ports for all electrodes and a sparging needle. Tetrabutylammonium hexafluorophosphate (TBAPF₆) was purified by recrystallization from ethanol and dried in a vacuum oven before being stored in a desiccator. All data were referenced to an internal ferrocene standard (ferricenium/ferrocene (Fc⁺/Fc) reduction potential under stated conditions) unless otherwise specified. All voltammograms were corrected for internal resistance. Ferrocene was purified by sublimation prior to use.

Controlled Potential Electrolysis (CPE)

CPE experiments were performed in a glass Pine Research Instrumentation H-cell with two compartments separated by a glass frit. A 55 mL stock solution of *N*,*N*-DMF with 0.1 M TBAPF₆ was prepared for each bulk electrolysis experiment. Approximately 26 mL of the stock solution was added to each half of the H-cell. One side of the H-cell contained the catalyst, any additional substrate, such as the mediator and/or PhOH, and a glassy carbon rod working electrode. The other side of the H-cell contained approximately 0.075 M ferrocene as a sacrificial reductant along with a graphite rod counter electrode and a Ag/AgCl pseudoreference electrode. The electrolysis experiment was referenced by taking a CV of the side of the H-cell that contained the ferrocene solution. The H-cell was sealed with two septa that were connected by a piece of PTFE tubing which aided to maintain equal pressure between each half of the cell during the electrolysis. Before starting the electrolysis experiment, both sides of the H-cell were sparged with the desired gas for 20 minutes and the sealed cell was allowed to equilibrate for 1 hour. The resistance between the two halves of the H-cell was measured using the i-interrupt procedure available in the NOVA software provided by Metrohm.

The concentration of catalyst was chosen so that the concentration of product within the H-cell remained in the optimal concentration range for GC product analysis described below. The ratio of catalyst to PhOH remained the same as well as the ratios for RM described for each individual experiment.

Controlled Potential Electrolysis (CPE) Product Analysis

During CPE experiments, either 50 or 250 μ L GC injections of the headspace were periodically taken for the detection and quantification of any gaseous products produced. After each CPE experiment, the total volume of solution was measured. The total volume of the sealed H-cell was also measured to account for the total headspace volume for accurate quantification of gaseous products. A calibration curve for CO and H₂ was used to quantify gaseous products produced during electrolysis experiments in the same manner as we previously reported.¹

Analysis of gas phase products was done by sampling electrolysis headspace through syringe injections into an Agilent 7890B GC equipped with a specialty gas split column 5 Å mol sieve/Porabond Q column (15 m length; 0.320 mm diameter; 25.0 μ m film) and thermal conductivity detector with He as a carrier gas. A calibration curve for CO and H₂ was made in the H-cell with an experimental setup containing identical volumes of *N*,*N*-DMF in 0.1 M TBAPF₆ to those used during electrolysis. Known volumes of CO and H₂ were injected into the cell with stirring and 250 μ L injections of the headspace were taken for GC injections after equilibration. The limit of detection (LOD) and limit of quantitation (LOQ) for CO and H₂ in the GC were determined from seven consecutive injections at the lowest observable concentrations of each gaseous product respectively. For CO, the LOD was determined to be 5.77 x 10⁻⁷ moles and the LOQ was determined to be 1.92 x 10⁻⁶ moles. For H₂, the LOD was determined to be 4.55 x 10⁻⁶ moles and the LOQ was determined to be 1.52 x 10⁻⁵ moles.

Gas Chromatography/Mass Spectrometry (GC/MS) Analysis of CPE Solutions

The samples for GC/MS analysis were prepared by diluting 0.1 mL of the CPE solution with 0.9 mL of dichloromethane (DCM). 1 μ L of these solutions were injected by a 7693A ALS into a 7890B GC equipped with an ultra inert column (30 m length; 0.25 mm diameter; 0.25 μ m film) and 5977B MSD.

Calculation of Overpotential for CO₂ Reduction with PhOH Present (Adapted)

The calculation of overpotential for all catalysts was performed according to reported methods.² The following equation was used for the determination of the reaction standard potential in V with respect to the Fc^+/Fc couple:

$$E_{CO2/CO} = -0.73 V - 0.059(pK_a)$$
 Eq (1)

The pK_a for PhOH in *N*,*N*-DMF is reported as 18.8:³

$$E_{CO2/CO}(PhOH) = -1.84 V vs Fc^{+}/Fc \qquad \text{Eq (2)}$$

The $E_{cat/2}$ determined experimentally for Cr(^{tbu}dhbpy)Cl(H₂O) and Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) is -1.95 V¹ and -2.00 V vs Fc⁺/Fc, respectively. For protic CO₂ reduction (1.0 mM catalyst and 0.1 M PhOH under CO₂ saturation); the overpotential is:

$$\eta = \left| E_{cat/2} - E_{CO2/CO} \right| \qquad \qquad \text{Eq (3)}$$

| Cr(^{tbu} dhbpy)Cl(H ₂ O) | $\eta = 110 \text{ mV}$ |
|---|-------------------------|
| Cr(^{tbu} dh ^{tbu} bpy)Cl(H ₂ O) | $\eta = 160 \text{ mV}$ |

This assumes no contribution from homoconjugation of the acid. We note that the homoconjugation constant (HA₂⁻) for PhOH in *N*,*N*-DMF has been reported as $log(K_{HA_2^-}) = 3.8.^4$ Therefore, we emphasize that the described overpotential calculated above for PhOH is the lower-limit approximation, as homoconjugation is expected to alter the effective overpotential. The overpotential equation can be modified to account for homoconjugation:

$$E_{CO2/CO} = -0.73 V - 0.059 (pK_a) - \frac{-2.303RT}{nF} \log (mK_{HA_2})$$
 Eq (4)

Where n = number of electrons (2) and m = number of proton transfers (2). The modified equation provides $E^{0}_{CO2/CO} = -1.72$ V and the following η values:

| Cr(^{tbu} dhbpy)Cl(H ₂ O) | $\eta = 230 \text{ mV}$ |
|---|-------------------------|
| Cr(^{tbu} dh ^{tbu} bpy)Cl(H ₂ O) | $\eta = 280 \text{ mV}$ |

This value does not account for the possible thermodynamic contributions of the water coordinated to the pre-catalyst, the equimolar quantities of water produced for each equivalent of CO generated, or any adventitious H₂O present in the CO₂, solvent, or electrolyte. Under CO₂ saturation, any water present can form carbonic acid, $pK_a(N,N$ -DMF) 7.37,⁵ and generate new equilibria involving CO₂ and bicarbonate. The role of carbonic acid (and the general hydration of CO₂ in non-aqueous solvent systems) in altering the overall thermodynamics combined with the effects of homoconjugation has been assessed by Matsubara.⁶ Considering the role of water, Matsubara obtained a standard potential for CO₂ reduction to CO of -1.70 V versus Fc⁺/Fc for PhOH in *N*,*N*-DMF with 10 mM water present (see below). Note the same value is obtained considering 10 mM water only.

| For 10 mM H ₂ O in <i>N</i> , <i>N</i> -DMF, where $AH = PhOH^{.6}$ | |
|--|-----------------------------|
| $3CO_{2(g)} + H_2O_{(sol,x)} + 2e^- \rightleftharpoons CO_{(g)} + 2HCO_{3(sol)}^-$ | $E^0 = -1.70 V vs.Fc^+/Fc$ |
| $CO_{2(g)} + 2AH_{(sol)} + 2e^{-} \rightleftharpoons CO_{(g)} + 2A^{-}_{(sol)} + H_2O_{(sol,x)}$ | $E^0 = -1.96 V vs. Fc^+/Fc$ |
| $CO_{2(g)} + 4AH_{(sol)} + 2e^{-} \rightleftharpoons CO_{(g)} + 2HA_{2(sol)}^{-} + H_2O_{(sol,x)}$ | $E^0 = -1.70 V vs. Fc^+/Fc$ |

Determination of TOF_{max} from Cyclic Voltammetry

The expression for TOF_{max} for a homogeneous electrocatalytic response (considering an application of steady-state conditions to the substrate) has been solved previously.^{1,7}

$$TOF_{max} = 0.1992 \frac{n_p^3}{n_{cat}^2} \frac{Fv}{RT} \left(\frac{i_{cat}}{i_p}\right)^2$$
 Eq (6)

Where n_p is the number of electrons transferred under faradaic conditions, n_{cat} is the number of electrons transferred under catalytic conditions, R is the ideal gas constant, F is Faraday's constant, v is the scan rate, T is temperature, i_{cat} is the catalytic current, and i_p is the Faradaic current.

Determination of TOF from Preparative Electrolysis

The integrated expression of current for a homogeneous electrocatalytic response (considering an application of steady-state conditions to the substrate) has been solved previously:^{8,9}

$$\frac{i}{FA} = \frac{n_{cat}^{\sigma}[cat]\sqrt{(k_{obs}D_{cat})}}{1 + \exp\left[\frac{F}{RT}(E_{app} - E_{1/2})\right]}$$
$$k_{obs} = k_{cat}[CO_2]$$

where *i* is the average current (Amps) specific to the reaction product of interest, *F* is Faraday's constant (96485 C mol⁻¹), *A* is the area of the electrode (cm²), n_{cat}^{σ} is the number of electrons in the catalytic process (2) with $\sigma = 1$ under the assumption that all electrons are delivered to the catalyst by the electrode electrode¹⁰ ($\sigma = 0.5$ corresponds to homogeneous electron transfer occuring between catalyst molecules in solution; used here for co-electrocatalytic conditions), [*cat*] is the concentration of the catalyst (mol cm⁻³), k_{obs} is the apparent turnover frequency (s⁻¹), [*CO*₂] is the concentration of CO₂ saturated in *N*,*N*-DMF (mol cm⁻³), D_{cat} is the diffusion coefficient of the catalyst (cm² s⁻¹), *R* is the ideal gas constant (Joule mol⁻¹ K⁻¹), *T* is the temperature (K), E_{app} is the applied potential during preparative electrolysis (V), and $E_{1/2}$ is the standard potential of the catalyst (V).

and

$$\frac{i}{A} = J = CO$$
 specific current density

Substituting and rearranging the first expression to solve for k_{obs}

$$k_{obs} = \frac{J^2 \left(1 + \exp\left[\frac{F}{RT} (E_{app} - E_{1/2})\right]\right)^2}{F^2 (n_{cat}^{\sigma} [cat])^2 D_{cat}}$$

with k_{obs} in hand, the *TOF* can be expressed for a given potential according to the following relationship

$$TOF = \frac{\kappa_{obs}}{1 + \exp\left[\frac{F}{RT}(E_{app} - E_{1/2})\right]}$$

Parameters for CPE experiments reported here not found in Table 1.

- E_{1/2} catalyst:
 - \circ -1.95 V vs Fc⁺/Fc for Cr(^{tbu}dhbpy)Cl(H₂O) 1
 - \circ -2.00 V vs Fc⁺/Fc for Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) 2
- Temperature: 298.15 K
- $[CO_2]: 2.3 \times 10^{-4} \text{ mol cm}^{-3}$
- Diffusion coefficient:
 - $\circ \ \ 2.0 \ x \ 10^{-6} \ cm^2 \ s^{-1} \ for \ Cr({}^{tbu}dhbpy)Cl(H_2O) \ 1 \\$
 - \circ 2.3 x 10⁻⁶ cm² s⁻¹ for Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2**
- Electrode area: 3.93 cm²

Calculation of Diffusion Coefficients

The calculation of the diffusion coefficient for each redox mediator was performed by reported methods.¹¹ Cyclic voltammetry (CV) experiments were done with a solution of 2.5 mM RM in 0.1 M TBAPF₆/N,N-DMF under Ar saturation conditions. The scan rate of these CVs was varied from 25 mV/s to 5000 mV/s (**Figures S22-S25**). The increase in current observed as the scan rate increases can be represented by the following equation where i_p is the peak current, n is the number of electrons, A is the area of the electrode, D is the diffusion coefficient, C is the concentration of analyte, and v is the scan rate:

$$i_p = (2.69 \times 10^5) n^{3/2} A C D^{1/2} v^{1/2}$$

By plotting the current density as a function of $v^{1/2}$ (Figures S22-S24), the slope can be used to find *D* for each RM.

$$D_{cat} = \frac{(\text{slope})^2}{n^3 C^2 (2.69 \times 10^5)^2}$$

Calculation of i_{cat}/i_p for Co-electrocatalytic Systems

A common technique for evaluating diffusion, electrode surface area, and concentration independent observed rate constants (k_{obs}) for a two-electron catalytic process is to determine i_{cat}/i_p for a catalytic system, where i_{cat} is the catalytic plateau current and i_p is the one-electron peak in the absence of substrate.¹² Due to the complex nature of the co-catalytic systems we present here, we are unable to calculate k_{obs} by this method. However, these ratios still offer an insightful measure into the relative current increase under catalytic conditions between systems that are sensitive to the diffusion coefficient of both co-catalysts.

To calculate the values of i_p and i_{cat} for all systems, the capacitive current must be subtracted from the measured current at either the peak or the plateau. To determine the potential to find the capacitive, peak, catalytic, and co-catalytic plateau currents, the first derivative was taken of the forward trace for CVs obtained with 1 or 2, RM, and PhOH under Ar (i_p) and under CO₂ (i_{cat}). Where the first derivative is equal to zero there is a plateau in the CV trace. The current in the CV at the same potential corresponding to a value of zero in the first derivative was used (**Figure S80A**). However, due to close overlap of features in the co-catalytic trace under CO₂, the local minima corresponding to the inflection point of the curve were used to determine an effective current plateau (**Figure S80B**). All CV data used had a scan rate = 100 mV/s.

Computational Methods

Geometry optimizations were performed without geometry constraints at the DFT level with the Gaussian 16 program, Rev B.01,¹³ employing the hybrid functional B3LYP¹⁴⁻¹⁷ and the def2-SVP basis set was used for all atoms.^{18, 19} Dispersion and bulk solvent effects (*N*,*N*-dimethylformamide = *N*,*N*-DMF; ε = 37.219) were accounted for at the optimization stage, by using Grimme's D3 parameter set with Becke-Johnson (BJ) damping^{20, 21} and the CPCM continuum model,²² respectively. The stationary points and their nature as minima (no imaginary frequencies) were characterized by vibrational analysis using the IGRRHO approach as implemented by default in the software package, which also produced enthalpy (H), entropy (S) and Gibbs energy (G) data at 298.15 K. The minima connected by a given transition state were determined by perturbing the

transition states along the TS coordinate and optimizing to the nearest minimum. Free energies were corrected (ΔG_{qh}) to account for concentration effects and for errors associated with the harmonic oscillator approximation. Thus, according to Truhlars's quasi-harmonic approximation for vibrational entropy and enthalpy, all vibrational frequencies below 100 cm⁻¹ were set to this value.²³ These anharmonic and concentration corrections were calculated with the Goodvibes code.²⁴ Concentrations were set at 0.001 M for metal complexes, 0.005 for RM and RM⁻, and 12.92 M for *N*,*N*-DMF. Energies were refined by means of single point calculations with the larger def2-TZVP basis set. The stability of the wavefunction and spin contamination were studied at the double- and triple-zeta levels of theory. Nucleus-Independent Chemical Shift (NICS)²⁵ values were computed for the mediators by computing magnetic shielding tensors of ghost atoms placed at the centroid of each ring using the Gauge Independent Atomic Orbital (GIAO)²⁶⁻²⁹ method at the B3LYP-D3BJ/def2-TZVP level of theory with the ORCA 5.0 program.³⁰

Kohn-Sham orbital projections and spin densities were plotted in ChemCraft with contour values of 0.030 and 0.0025, respectively. The color scheme used for atoms is C = black, O = red, N = blue, H = grey, S = yellow and Cr = maroon. For added clarity, select figures were generated with truncated structures and omitted H atoms as indicated in the respective captions; all calculations were performed using the complete structural model. The labelling scheme for minima is multiplicity $Cr(axial ligands)^{charge}$ and multiplicity RM^{charge} for RM species; the [^{tbu}dhbpy]^{2–} or [^{tbu}dh^{tbu}bpy]^{2–} ligand framework is a common feature of all Cr species and does not change its coordination mode during the reaction, so it is omitted in the notation where possible for clarity. The spin doublets considered for all co-electrocatalytic assemblies showed significant spin contamination; these are included in the .xyz file for completeness.

Single crystal X-ray diffraction

A single crystal of each sample was coated with Paratone oil and mounted on a MiTeGen MicroLoop. The X-ray intensity data were measured on a Bruker Kappa APEXII Duo system equipped with an Incoatec Microfocus I μ S (Cu K $_{\alpha}$, $\lambda = 1.54178$ Å) and a multi-layer mirror monochromator, and a fine-focus sealed tube (Mo K $_{\alpha}$, $\lambda = 0.71073$ Å) and a graphite monochromator or Bruker D8 Venture Kappa four-circle diffractometer system equipped with an Incoatec I μ S 3.0 micro-focus sealed X-ray tube (Mo K α , $\lambda = 0.71073$ Å) and a HELIOS double bounce multilayer mirror monochromator.

The frames were integrated with the bruker SAINT software package³¹ using a narrow-frame algorithm. Data were corrected for absorption effects using the Multi-Scan method (SADABS or TWINABS).³² Each structure was solved and refined using the Bruker SHELXTL Software Package³² within APEX3³¹ and OLEX2.³³ Non-hydrogen atoms were refined anisotropically. The O-H hydrogen atoms were located in the electron density map and refined isotropically. All other hydrogen atoms were placed in geometrically calculated positions with $U_{iso} = 1.2U_{equiv}$ of the parent atom ($U_{iso} = 1.5U_{equiv}$ for methyl).

Both polymorphs of tbu dhbpy(H)₂ were twinned. For polymorph 1, a two-domain twin was identified using CELL_NOW.³⁴ Starting with 767 reflections, 620 reflections were fit to the first domain, and 539 to the second domain (132 exclusively), with 15 unindexed reflection remaining.

The twin domain was oriented at a 179.8° rotation about the reciprocal axis 0.000 0.001 1.000. The twin law was -0.998 -0.004 0.001 / 0.004 -1.002 0.001 / -0.642 -0.366 1.000. It was refined on on HKLF5 data, with the BASF for the twin domain refining to 0.33031. For polymorph 2, a three-domain twin was identified using CELL NOW.³⁴ Starting with 1469 reflections, 1084 reflections were fit to the first domain, 1073 to the second domain (246 exclusively), and 189 to the third domain (43 exclusively) with 96 unindexed reflection remaining. The second domain was oriented at a 179.9° rotation about the reciprocal axis 0.000 0.000 1.000. The twin law was -0.999 0.002 0.004 / 0.000 -1.001 -0.002 / 0.539 0.999 1.000. The third domain was oriented at a 179.7° rotation about the real axis 1.000 -0.411 -0.412 and its twin law was -0.039 -0.398 -0.398 /-0.553 -0.768 0.234 /-1.956 0.796 -0.193. It was refined on HKLF5 data, with the BASF for the twin domains refining to 0.47711 and 0.02195. For 2, one tert-butyl group was found to be disordered across two positions. The relative occupancy of the positions was freely refined, with constraints on the anisotropic displacement parameters of the disordered atoms. Chloroform and hexane solvent located in the crystal lattice was severely disordered and could not be adequately modeled with or without restraints. Thus, the structure factors were modified using the PLATON SQUEEZE³⁵ technique, in order to produce a "solvate-free" structure factor set. PLATON reported a total electron density of 326 e⁻ and total solvent accessible volume of 1276 Å³.

Synthesis and Characterization

Synthesis of 6,6'-Di(3,5-di-*tert*-**butyl-2-hydroxybenzene)-2,2'-bipyridine**, ^{tbu}**dhbpy(H)**₂ The synthesis of ^{tbu}**dhbpy(H)**₂ was carried out as previously reported.¹

Synthesis of Cr(^{tbu}dhbpy)Cl(H₂O) (1)

The metalation of tbu dhbpy(H)₂ to generate Cr(tbu dhbpy)Cl(H₂O) (1) was carried out as previously reported¹ with one modification: the resulting product was further purified by dissolving in dichloromethane (DCM) and passing through a PTFE syringe filter to remove excess starting metal salt.

Synthesis of 6,6'-Di(3,5-di-*tert*-butyl-2-hydroxybenzene)-4,4'-di-*tert*-butyl-2,2'-bipyridine, ^{tbu}dh^{tbu}bpy(H)₂

The starting materials for this reaction, dichloro-4,4'-di-*tert*-butyl-2,2'-bipyridine^{36, 37} and (3,5-di-*tert*-butyl-2-hydroxy-phenyl)boronic acid¹, were all prepared by previously reported methods.

Two microwave tubes were each charged with 6,6'-dichloro-4,4'-di-tert-butyl-2,2'-bipyridine (0.755 g, 2.24 mmol), unpurified (3,5-di-tert-butyl-2-hydroxy-phenyl)boronic acid (1.96 g, 38.2 mmol), sodium carbonate (1.76 g, 16.6 mmol), Pd(PPh₃)₄ (0.04 g, 0.03 mmol), and degassed toluene (30 mL), water (12 mL), and methanol (8 mL). The microwave conditions were set to heat the reaction mixture to 170 °C as fast as possible and then held at that temperature for 140 minutes. After cooling, the two tubes were combined, and aqueous and organic fractions were separated and extracted. The organic layer was washed with brine (3 x 50 mL) and the aqueous layer was extracted with dichloromethane (4 x 75 mL). All organic fractions were combined and dried over MgSO₄ before removing the solvent via reduced pressure leaving a bright yellow oil. Methanol was added to the flask to dissolve excess boronic acid still present and a yellow solid crashed out of solution. Finally, the solution was filtered and the solid collected on the frit was washed with additional methanol leaving a bright yellow solid with an isolated yield of 30.5% (0.922 g). ¹H NMR (CD₂Cl₂, 600 MHz): δ 14.60 (s, 2H, OH), 8.22 (d, 2H, ArH), 7.98 (d, 2H, ArH), 7.74 (d, 2H, ArH), 7.44 (d, 2H, ArH), 1.51 (s, 18H, -C(CH₃)₃), 1.50 (s, 18H, -C(CH₃)₃), 1.40 (s, 18H, $-C(CH_3)_3$). ¹³C{¹H} NMR (CD₂Cl₂, 150 MHz): δ 163.7 (ArC), 159.0 (ArC), 157.0 (ArC), 152.2 (ArC), 140.5 (ArC), 126.56 (ArC), 121.5 (ArC), 119.0 (ArC), 117.7 (ArC), 116.8 (ArC), 110.5 (ArC), 35.9 (tbuC), 35.7 (tbuC), 34.7 (tbuC), 31.8 (tbuC), 30.7 (tbuC), 29.8 (tbuC). Elemental Analysis for C₄₆H₆₄N₂O₂ calc'd: C 81.61, H 9.53, N 4.14; found: C 81.10, H 9.79, N 4.15.

Synthesis of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) (2)

Metalation of ^{tbu}dh^{tbu}bpy(H)₂ with Cr(III) to generate Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) (**3**) was achieved by stirring ^{tbu}dh^{tbu}bpy(H)₂ (0.295 g, 0.436 mmol) and 1.05 equivalents of chromium(II) dichloride (0.0562 g, 0.458 mmol) in tetrahydrofuran (60 mL) at room temperature under an inert atmosphere for seven days. After exposing the reaction to air, the THF was removed under reduced pressure. The solid was then dissolved in DCM and washed with brine (3 x 50 mL) and saturated ammonium chloride (6 x 50 mL). The organic layer was then dried over MgSO₄ and condensed under reduced pressure. The resulting solid was dissolved in minimal DCM and passed through a PTFE syringe filter. Finally, the DCM was removed, and the resulting solid was collected in a frit using pentanes to give a bright red solid. 54.5% isolated yield (0.185 g). Elemental analysis for C₄₆H₆₄ClCrN₂O₃·CH₂Cl₂ calc'd: C 65.23, H 7.69, N 3.24; found: C 65.36, H 7.64, N 3.69. ESI-MS (m/z): [Cr(^{tbu}dh^{tbu}bpy)]–Cl–H₂O+CH₃OH calc'd: 458.4479 found: 758.4084.

Synthesis of Triphenylothiophene 4,4-dioxide, TPTD

The synthesis of triphenylothiophene 4,4-dioxide (TPTD) was carried out following a previously reported method.^{38, 39}

Synthesis of 2,8-Dimesityldibenzothiophene 5,5-dioxide, Mes₂DBTD

2,8-dibromodibenzothiophene 5,5-dioxide was prepared by a previously reported method.^{40, 41} Three microwave tubes were each filled with 2,8-dibromodibenzothiophene 5,5-dioxide (0.503 g, 1.35 mmol), (2,4,6-trimethylphenyl)boronic acid (0.553 g, 3.37 mmol), sodium carbonate (3.77 g, 35.7 mmol), Pd(PPh₃)₄ (0.124 g, 0.108 mmol), and degassed toluene (30 mL), water (12 mL), and methanol (8 mL). The microwave conditions were set to heat the reaction mixture to 170 °C as fast as possible and then held at that temperature for 200 minutes. After cooling, the three tubes were combined, and the toluene layer was set aside. The aqueous layer was extracted with dichloromethane (6 x 100 mL). All organic fractions were combined and dried over MgSO₄ before removing the solvent via reduced pressure leaving a white solid. The solid was first recrystallized by methanol and then a second recrystallization was done using minimal hot ethyl acetate and methanol to give a fluffy white solid. 51.9% isolated yield (0.949 g). ¹H NMR (CD₂Cl₂, 600 MHz): δ 7.88 (dd, 2H, ArH), 7.57 (dd, 2H, ArH), 7.34 (dd, 2H, ArH), 6.96 (s, 4H, ArH), 2.31 (s, 6H, -CH₃), 2.02 (s, 6H, -CH₃). ¹³C{¹H} NMR (CD₂Cl₂, 150 MHz): δ 148.4 (ArC), 138.2 (ArC), 137.5 (ArC), 137.0 (ArC), 135.9 (ArC), 132.7 (ArC), 132.3 (ArC), 128.9 (ArC), 123.5 (ArC), 122.6 (ArC), 21.3 (MeC), 21.0 (MeC). Elemental Analysis for C₃₀H₂₈O₂S·[C₄H₈O₂]_{1/3} calc'd: C 78.08, H 6.41, N 0.00; found: C 78.14, H 6.29, N 0.02. ESI-MS (m/z): calc'd: 452.1010; found 452.1803.

Synthesis of 2,8-Diphenyldibenzothiophene 5,5-dioxide, Ph₂DBTD

2,8-Dibromodibenzothiophene 5,5-dioxide (1.00 g, 2.67 mmol), phenylboronic acid (0.750 g, 6.15 mmol), K₃PO₄ (0.57 g, 2.7 mmol), Pd(PPh₃)₄ (0.15 g, 0.13 mmol), and 1,4-dioxane (100 mL) were added to a 250 mL pressure flask with a stir bar in an inert atmosphere glovebox. The reaction was stirred at 130 °C under inert atmosphere for 3 days. After cooling to room temperature, the reaction was exposed to air. The reaction was then diluted with brine (75 mL) and the dioxane layer was separated. The aqueous layer was then extracted with DCM (5 x 75 mL) and all organic layers were dried over MgSO₄. Silica was added to the flask (15 g) and the solvent was removed to dryness under reduced pressure. The dry loaded sample was then separated by column chromatography with hexanes and DCM as eluent. Solvent mixture was initially 50% hexanes and 50% DCM and gradually adjusted to 100% DCM. The third fraction was collected and solvent was removed to yield an off-white solid with an isolated yield of 0.288 g, 29.2% yield. ¹H NMR (CD₂Cl₂, 600 MHz): δ 8.74 (s, 1H, ArH), 8.06 (d, 1H, ArH), 7.97 (dd, 1H, ArH), 7.91 (d, 2H, ArH), 7.57 (t, 2H, ArH) 7.50 (t, 1H, ArH). ¹³C{¹H} NMR (CD₂Cl₂, 150 MHz): δ 147.8 (ArC), 139.8 (ArC), 137.4 (ArC), 132.8 (ArC), 130.0 (ArC), 129.7 (ArC), 129.4 (ArC), 127.9 (ArC), 122.8 (ArC), 121.0 (ArC). Elemental Analysis for C₂₄H₁₆O₂S calcd: C 78.27, H 4.38, N 0.00; found: C 77.67, H 4.38, N 0.01. ESI-MS (m/z): calcd: 368.0871; found 368.0872.

Evans' Method Characterization of 2

The spin state of the Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) (**2**) catalyst was characterized as a Cr(III) species via Evans' Method.^{42, 43} Three capillary inserts were made with a 50% v/v mixture of *N*,*N*-DMF and *N*,*N*-DMF-*d*₇. Each insert was flame sealed, and then placed in an NMR tube. Then 8.3 mg of **2** was dissolved in 3 mL of *N*,*N*-DMF. Approximately 0.6 mL of the solution of **2** was added to each of the three NMR tubes containing a flame sealed insert. ¹H NMR spectra with 64 scans were then taken using a 600 MHz Varian NMR Spectrometer. The results of this experiment, which was run in triplicate, can be seen in **Table S3**. The average μ_{eff} of **2** was 3.86±0.10.

Figure S1. The two polymorphs of single crystal structures of ^{tbu}dhbpy(H)₂ ligand obtained from X-ray diffraction studies. Blue = N, red = O, gray = C; thermal ellipsoids at 50%; H atoms omitted for clarity. CCDC 1984950 (left) and 1984949 (right).

The slope highlighted in yellow was used to calculate the diffusion coefficient in Table S6. The data in B was obtained from the reversible redox feature at -2.19 V vs Fc⁺/Fc. Conditions: 0.1 M TBAPF₆/DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; varied scan rate; referenced to internal ferrocene standard.

Figure S24. (A) CVs of 2.5 mM Ph₂DBTD at variable scan rates ranging from 25 (black) to 5000 (red) mV/s, obtained under Ar saturation conditions. (B) Linear Fit of variable scan rate data from A demonstrating that DBTD shows a diffusion-limited current response. The slope highlighted in yellow was used to calculate the diffusion coefficient in Table S6. The data in B was obtained from the reversible redox feature at -2.12 V vs Fc⁺/Fc. Conditions: 0.1 M TBAPF₆/DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; varied scan rate; referenced to internal ferrocene standard.

Figure 25. (A) CVs of 2.5 mM Mes₂DBTD at variable scan rates ranging from 25 (black) to 5000 (red) mV/s, obtained under Ar saturation conditions. (B) Linear Fit of variable scan rate data from A demonstrating that DBTD shows a diffusion-limited current response. The slope highlighted in yellow was used to calculate the diffusion coefficient in Table S6. The data in B was obtained from the reversible redox feature at -2.24 V vs Fc⁺/Fc. Conditions: 0.1 M TBAPF₆/DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; varied scan rate; referenced to internal ferrocene standard.

| | Number of electrons | Concentration (mM) | Slope | Diffusion Coefficient (cm ² /s) |
|-----------------------|------------------------|-----------------------|----------|---|
| DBTD | 1 | 2.50 | -0.00168 | 6.22 x 10 ⁻⁶ |
| TPTD | 1 | 2.40 | -0.00128 | 3.93 x 10 ⁻⁶ |
| Ph ₂ DBTD | 1 | 2.50 | -0.00129 | 3.68 x 10 ⁻⁶ |
| Mes ₂ DBTD | 1 | 2.50 | -0.00127 | 3.57 x 10 ⁻⁶ |

Table S6. Results of Diffusion Coefficient Calculations

Cyclic Voltammetry Under Protic Conditions

Figure S26. Comparison of CVs of 1.0 mM Cr(^{bu}dhbpy)Cl(H₂O) **1** with and without 2.5 mM TPTD and 0.1 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/DMF; glassy carbon working electrode, glassy carbon rod counter electrode, Ag/AgCl pseudoreference electrode; referenced to Fc⁺/Fc internal standard; 100 mV/s scan rate.

Figure S27. Comparison of CVs of 1.0 mM Cr(^{bu}dhbpy)Cl(H₂O) **1** with and without 2.5 mM Mes₂DBTD and 0.1 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/DMF; glassy carbon working electrode, glassy carbon rod counter electrode, Ag/AgCl pseudoreference electrode; referenced to Fc⁺/Fc internal standard; 100 mV/s scan rate.

Figure S28. Comparison of CVs of 1.0 mM Cr(^{bu}dhbpy)Cl(H₂O) **1** with and without 2.5 mM Ph₂DBTD and 0.1 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/DMF; glassy carbon working electrode, glassy carbon rod counter electrode, Ag/AgCl pseudoreference electrode; referenced to Fc⁺/Fc internal standard; 100 mV/s scan rate.

Figure S29. (A) CVs of Cr(^{tbu}dhbpy)Cl(H₂O) **1** at variable concentrations, obtained under CO₂ saturation with 2.5 mM TPTD and 0.325 M PhOH. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.34 V vs. Fc⁺/Fc.

Figure S30. (A) CVs of Cr(^{tbu}dhbpy)Cl(H₂O) **1** at variable concentrations, obtained under CO₂ saturation with 2.5 mM Mes₂DBTD and 0.325 M PhOH. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.36 V vs. Fc⁺/Fc.

Figure S31. (A) CVs of Cr(^{tbu}dhbpy)Cl(H₂O) **1** at variable concentrations, obtained under CO₂ saturation with 2.5 mM Ph₂DBTD and 0.325 M PhOH. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.25 V vs. Fc⁺/Fc.

Figure S32. (A) CVs of 1.0 mM Cr(^{tbu}dhbpy)Cl(H₂O) **1** with 0.325 M PhOH at variable TPTD concentrations, obtained under CO₂ saturation. Conditions: 0.1 M TBAPF₆/N,N-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (B) Log-log plot from data obtained from CVs in A at -2.38 V vs. Fc⁺/Fc.

Figure S33. (A) CVs of 1.0 mM Cr(^{tbu}dhbpy)Cl(H₂O) **1** with 0.325 M PhOH at variable Mes₂DBTD concentrations, obtained under CO₂ saturation. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Loglog plot from data obtained from CVs in **A** at -2.43 V vs. Fc⁺/Fc.

Figure S34. (**A**) CVs of 1.0 mM Cr(^{tbu}dhbpy)Cl(H₂O) **1** with 0.325 M PhOH at variable Ph₂DBTD concentrations, obtained under CO₂ saturation. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.33 V vs. Fc⁺/Fc.

Figure S35. (A) CVs where the concentrations of $Cr(^{tbu}dhbpy)Cl(H_2O)$ **1** and TPTD were varied at a fixed 1:5 ratio of **1**:TPTD with 0.325 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.34 V vs. Fc⁺/Fc.

Figure S36. (A) CVs where the concentrations of Cr(^{tbu}dhbpy)Cl(H₂O) **1** and Mes₂DBTD were varied at a fixed 1:5 ratio of **1**:Mes₂DBTD with 0.325 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.40 V vs. Fc⁺/Fc.

Figure S37. (A) CVs where the concentrations of Cr(^{tbu}dhbpy)Cl(H₂O) **1** and Ph₂DBTD were varied at a fixed 1:5 ratio of **1**:Ph₂DBTD with 0.325 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.27 V vs. Fc⁺/Fc.

Figure S38. (A) CVs of PhOH at variable concentrations, obtained under CO₂ saturation with 1.0 mM Cr(^{tbu}dhbpy)Cl(H₂O) **1** and 2.5 mM TPTD. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.34 V vs. Fc⁺/Fc.

Figure S39. (A) CVs of PhOH at variable concentrations, obtained under CO₂ saturation with 1.0 mM Cr(^{tbu}dhbpy)Cl(H₂O) **1** and 2.5 mM Mes₂DBTD. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.40 V vs. Fc⁺/Fc.

Figure S40. (A) CVs of PhOH at variable concentrations, obtained under CO₂ saturation with 1.0 mM Cr(^{tbu}dhbpy)Cl(H₂O) **1** and 2.5 mM Ph₂DBTD. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.27 V vs. Fc⁺/Fc.

Figure S41. (A) CVs of 1.0 mM Cr(^{tbu}dhbpy)Cl(H₂O) **1**, 2.5 mM TPTD, 0.325 M PhOH at varied CO₂ concentrations. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.29 V vs. Fc⁺/Fc.

Figure S42. (A) CVs of 1.0 mM Cr(^{tbu}dhbpy)Cl(H₂O) **1**, 2.5 mM Mes₂DBTD, 0.325 M PhOH at varied CO₂ concentrations. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.36 V vs. Fc⁺/Fc.

Figure S43. (A) CVs of 1.0 mM Cr(^{tbu}dhbpy)Cl(H₂O) **1**, 2.5 mM Ph₂DBTD, 0.325 M PhOH at varied CO₂ concentrations. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.26 V vs. Fc⁺/Fc.

Figure S44. Comparison of CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** with and without 2.5 mM DBTD and 0.1 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/DMF; glassy carbon working electrode, glassy carbon rod counter electrode, Ag/AgCl pseudoreference electrode; referenced to Fc⁺/Fc internal standard; 100 mV/s scan rate.

Figure S45. Comparison of CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** with and without 2.5 mM TPTD and 0.1 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/DMF; glassy carbon working electrode, glassy carbon rod counter electrode, Ag/AgCl pseudoreference electrode; referenced to Fc⁺/Fc internal standard; 100 mV/s scan rate.

Figure S46. Comparison of CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** with and without 2.5 mM Mes₂DBTD and 0.1 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/DMF; glassy carbon working electrode, glassy carbon rod counter electrode, Ag/AgCl pseudoreference electrode; referenced to Fc⁺/Fc internal standard; 100 mV/s scan rate.

Figure S47. Comparison of CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** with and without 2.5 mM Ph₂DBTD and 0.1 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/DMF; glassy carbon working electrode, glassy carbon rod counter electrode, Ag/AgCl pseudoreference electrode; referenced to Fc⁺/Fc internal standard; 100 mV/s scan rate.

Figure S48. (A) CVs of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** at variable concentrations, obtained under CO₂ saturation with 2.5 mM DBTD and 0.325 M PhOH. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.41 V vs. Fc⁺/Fc.

Figure S49. (A) CVs of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** at variable concentrations, obtained under CO₂ saturation with 2.5 mM TPTD and 0.325 M PhOH. Conditions: 0.1 M TBAPF₆/N,N-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.38 V vs. Fc⁺/Fc.

Figure S50. (A) CVs of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** at variable concentrations, obtained under CO₂ saturation with 2.5 mM Mes₂DBTD and 0.325 M PhOH. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.45 V vs. Fc⁺/Fc.

Figure S51. (A) CVs of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** at variable concentrations, obtained under CO₂ saturation with 2.5 mM Ph₂DBTD and 0.325 M PhOH. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.32 V vs. Fc⁺/Fc.

Figure S52. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** with 0.325 M PhOH at variable DBTD concentrations, obtained under CO₂ saturation. Conditions: 0.1 M TBAPF₆/N,N-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.56 V vs. Fc⁺/Fc.

Figure S53. (**A**) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** with 0.325 M PhOH at variable TPTD concentrations, obtained under CO₂ saturation. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.37 V vs. Fc⁺/Fc.

Figure S54. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** with 0.325 M PhOH at variable Mes₂DBTD concentrations, obtained under CO₂ saturation. Conditions: 0.1 M TBAPF₆/N,N-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (B) Loglog plot from data obtained from CVs in A at -2.54 V vs. Fc⁺/Fc.

Figure S55. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** with 0.325 M PhOH at variable Ph₂DBTD concentrations, obtained under CO₂ saturation. Conditions: 0.1 M TBAPF₆/N,N-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (B) Log-log plot from data obtained from CVs in A at -2.37 V vs. Fc⁺/Fc.

Figure S56. (A) CVs where the concentrations of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and DBTD were varied at a fixed 1:5 ratio of **1**:DBTD with 0.325 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/N,N-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (B) Log-log plot from data obtained from CVs in A at -2.43 V vs. Fc⁺/Fc.

Figure S57. (**A**) CVs where the concentrations of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and TPTD were varied at a fixed 1:5 ratio of **1**:TPTD with 0.325 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.41 V vs. Fc⁺/Fc.

Figure S58. (A) CVs where the concentrations of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and Mes₂DBTD were varied at a fixed 1:5 ratio of **1**:Mes₂DBTD with 0.325 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.45 V vs. Fc⁺/Fc.

Figure S59. (A) CVs where the concentrations of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and Ph₂DBTD were varied at a fixed 1:5 ratio of **1**:Ph₂DBTD with 0.325 M PhOH under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.35 V vs. Fc⁺/Fc.

Figure S60. (**A**) CVs of PhOH at variable concentrations, obtained under CO₂ saturation with 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and 2.5 mM DBTD. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.42 V vs. Fc⁺/Fc.

Figure S61. (A) CVs of PhOH at variable concentrations, obtained under CO₂ saturation with 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and 2.5 mM TPTD. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.43 V vs. Fc⁺/Fc.

Figure S62. (**A**) CVs of PhOH at variable concentrations, obtained under CO₂ saturation with 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and 2.5 mM Mes₂DBTD. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.44 V vs. Fc⁺/Fc.

Figure S63. (**A**) CVs of PhOH at variable concentrations, obtained under CO₂ saturation with 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and 2.5 mM Ph₂DBTD. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.32 V vs. Fc⁺/Fc.

Figure S64. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2**, 2.5 mM DBTD, 0.325 M PhOH at varied CO₂ concentrations. Conditions: 0.1 M TBAPF₆/N,N-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.42 V vs. Fc⁺/Fc.

Figure S65. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2**, 2.5 mM TPTD, 0.325 M PhOH at varied CO₂ concentrations. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.39 V vs. Fc⁺/Fc.

Figure S66. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2**, 2.5 mM Mes₂DBTD, 0.325 M PhOH at varied CO₂ concentrations. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.43 V vs. Fc⁺/Fc.

Figure S67. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2**, 2.5 mM Ph₂DBTD, 0.325 M PhOH at varied CO₂ concentrations. Conditions: 0.1 M TBAPF₆/N,N-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.33 V vs. Fc⁺/Fc.

Controlled Potential Electrolysis Experiments (Protic Conditons)

Figure S68. (A) Current versus time trace from CPE experiments of 1+TPTD+PhOH. (B) Charge passed versus time for the CPE experiments shown in A. Conditions were 0.1 mM $Cr(^{tbu}dhbpy)Cl(H_2O)$ 1, 0.12 M PhOH, and either 0.1, 0.3, or 0.5 (blue) mM TPTD under a CO₂ atmosphere at -2.25 V vs Fc⁺/Fc in 0.1 M TBAPF₆/N,N-DMF; working electrode was a glassy carbon rod, counter electrode was a graphite rod, and the reference was a nonaqueous Ag/AgCl pseudoreference electrode; 0.075 M Fc was used as sacrificial oxidant.

| Time (s) | Charge (coulombs) | moles (e ⁻) | Moles of CO | FE _{CO} |
|----------|-------------------|-------------------------|-------------------------|------------------|
| 10828 | 4.17 | 4.32 x 10 ⁻⁵ | 2.02 x 10 ⁻⁵ | 93.5 |

Table S30. Results from CPE experiment in Figure S77, Mes₂DBTD + PhOH.

Figure S78. (A) Current versus time trace of control CPE experiment with DBTD and PhOH under N₂. (B) Gas chromatograph of the pre- and post-CPE solution. The mass spectrum for the peak at 9.9 min in the pre-CPE sample (C) and 9.8 min for the post-CPE sample (D) corresponds to DBTD. The MS spectrum of the peak at 7.9 min in the post-CPE sample corresponds to dibenzothiophene 5-oxide (E). Conditions for (A) were 5 mM DBTD and 0.1 M PhOH under a N₂ atmosphere at -2.30 V vs Fc⁺/Fc in 0.1 M TBAPF₆/*N*,*N*-DMF; working and counter electrodes were carbon cloth and the reference was a nonaqueous Ag/AgCl pseudoreference electrode; 0.075 M Fc was used as sacrificial oxidant.

Figure S79. (A) Current versus time trace of control CPE experiment with 1, DBTD, and PhOH under CO₂. (B) Gas chromatograph of the pre- and post-CPE solution. The mass spectrum for the peak at 9.8 min in the pre-CPE sample (C) and 9.7 min for the post-CPE sample (D) corresponds to DBTD. The MS spectrum of the peak at 6.9 min in the post-CPE sample likely corresponds to [1,1'-biphenyl]-2-thiol (E). The MS spectrum of the peak at 7.9 min in the post-CPE sample corresponds to dibenzothiophene 5-oxide (F). Conditions for (A) were 0.5 mM Cr(^{tbu}dhbpy)Cl(H₂O) 1, 2.5 mM DBTD and 0.6 M PhOH under a N₂ atmosphere at -2.30 V vs Fc⁺/Fc in 0.1 M TBAPF₆/N,N-DMF; working and counter electrodes were graphite rods, and the reference was a nonaqueous Ag/AgCl pseudoreference electrode; 0.075 M Fc was used as sacrificial oxidant.

<u>Analysis of Electrochemical CO₂ Reduction Under Aprotic</u> <u>Conditions</u>

Previously we observed that the addition of DBTD to a solution of 1 under CO₂ saturation conditions lead to the appearance of an aprotic catalytic feature that is not intrinsic to either component.⁴⁵ The addition of TPTD (Figure S91) to a solution of 1 and CO₂ leads to the appearance of an irreversible redox feature at the $E_{1/2}$ of TPTD (-2.19 V vs. Fc⁺/Fc), although the increase is less than that observed for DBTD. Despite a 120 mV difference in standard potential, Mes₂DBTD and Ph₂DBTD RMs demonstrate roughly the same increase in the observed current density and some retention of the return oxidation feature of the RM. This suggests an excess of the RM radical anion is being generated with respect to its rate of interaction with complex 1, and as a result, on the return CV sweep the radical anion is still present for re-oxidation, leading to the observed quasi-reversibility. When we compare these data with the aprotic CV data for all four RMs with 2, we see a deviation from the trend described for 1 above: the addition of all RMs lead to a completely irreversible wave (Figure S91). Notably, TPTD shows a significant increase in current density over DBTD when added to a solution of 2 under CO₂ saturation conditions (Figure **S91B**, red). Variable concentration studies were completed for all systems that produce an electrochemically irreversible system under aprotic conditions: the observed current density is proportional to the concentration of all reaction components (Figures S92-S108).

CPE experiments were then performed to assess reaction efficiency under aprotic conditions. Unlike the results for 1+DBTD, all new systems reported here (1 with the new RMs and 2 with all RMs) demonstrated insignificant catalytic properties under tested electrolysis conditions. The CPE experiments for 1 with Mes₂DBTD and TPTD as the RM and 2 with all four RMs led to a rapid loss of activity: following an initial stable period, current quickly diminishes

(Figures S109-S114), with no amount of CO detected above limit of quantification (LOQ, see SI). Initial stability followed by rapid loss of activity suggests molecular adsorption to the electrode, resulting in a passivation of the electrode surface.⁴⁶ Comparing these results with control CPE experiments of 1,⁴⁵ 2, DBTD,⁴⁵ TPTD, Mes₂DBTD, and Ph₂DBTD individually under aprotic conditions (Figures S115-S118) also showed either no CO or the presence of non-quantifiable amounts of CO (Table S42-S44). A similar phenomenon is observed when Ph₂DBTD is used as the RM with 1 (Figure S119), but in this case the system has a FE_{CO} = $26\pm2\%$ (Table S45) and ¹H NMR of the post-bulk solution shows the appearance of carbonate (CO₃²⁻), but no other carbon-containing products (Figure S120). Although CV data indicates that some of these combinations should result in aprotic catalytic activity, these combinations are not stable under the tested electrolysis conditions.

Cyclic Voltammetry Under Aprotic Conditions

Figure S91. CVs of 1.0 mM Cr(^{tbu}dhbpy)Cl(H₂O) **1** (**A**) or Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** (**B**) with 2.5 mM DBTD (black), TPTD (red), Mes₂DBTD (green), and Ph₂DBTD (blue) as the RM under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/DMF; glassy carbon working electrode, glassy carbon rod counter electrode, Ag/AgCl pseudoreference electrode; referenced to Fc⁺/Fc internal standard; 100 mV/s scan rate.

Figure S92. (A) CVs of Cr(^{tbu}dhbpy)Cl(H₂O) **1** at variable concentrations, obtained under CO₂ saturation with 2.5 mM TPTD. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.29 V vs. Fc⁺/Fc.

Figure S93. (A) CVs where the concentrations of Cr(^{tbu}dhbpy)Cl(H₂O) **1** and TPTD were varied at a fixed 1:5 ratio of **1**:TPTD under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (B) Loglog plot from data obtained from CVs in A at -2.30 V vs. Fc⁺/Fc.

Figure S94. (A) CVs of 1.0 mM Cr(^{tbu}dhbpy)Cl(H₂O) **1** and 2.5 mM TPTD at varied CO₂ concentrations. Conditions: 0.1 M TBAPF₆/N,N-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (B) Log-log plot from data obtained from CVs in A at -2.29 V vs. Fc⁺/Fc.

The variable concentration experiment for TPTD with fixed concentrations of 1 and CO₂ could not be completed. The co-catalytic effect quickly reached saturation and the irreversible redox feature became obscured by unbound TPTD in solution.

Figure S95. (A) CVs of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** at variable concentrations, obtained under CO₂ saturation with 2.5 mM DBTD. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.36 V vs. Fc⁺/Fc.

Figure S96. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** at variable DBTD concentrations, obtained under CO₂ saturation. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.41 V vs. Fc⁺/Fc.

Figure S97. (**A**) CVs where the concentrations of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and DBTD were varied at a fixed 1:5 ratio of **1**:DBTD under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Loglog plot from data obtained from CVs in **A** at -2.38 V vs. Fc⁺/Fc.

Figure S98. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and 2.5 mM DBTD at varied CO₂ concentrations. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (B) Log-log plot from data obtained from CVs in A at -2.36 V vs. Fc⁺/Fc.

Figure S99. (A) CVs of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** at variable concentrations, obtained under CO₂ saturation with 2.5 mM TPTD. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.36 V vs. Fc⁺/Fc.

Figure S100. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** at variable TPTD concentrations, obtained under CO₂ saturation. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.38 V vs. Fc⁺/Fc.

Figure S101. (**A**) CVs where the concentrations of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and TPTD were varied at a fixed 1:5 ratio of **1**:TPTD under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Loglog plot from data obtained from CVs in **A** at -2.48 V vs. Fc⁺/Fc.

Figure S102. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and 2.5 mM TPTD at varied CO₂ concentrations. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (B) Log-log plot from data obtained from CVs in A at -2.37 V vs. Fc⁺/Fc.

Figure S103. (A) CVs of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** at variable concentrations, obtained under CO₂ saturation with 2.5 mM Mes₂DBTD. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (B) Log-log plot from data obtained from CVs in A at -2.37 V vs. Fc⁺/Fc.

Figure S104. (A) CVs where the concentrations of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and Mes₂DBTD were varied at a fixed 1:5 ratio of **1**:Mes₂DBTD under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Loglog plot from data obtained from CVs in **A** at -2.50 V vs. Fc⁺/Fc.

Figure S105. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and 2.5 mM Mes₂DBTD at varied CO₂ concentrations. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (B) Log-log plot from data obtained from CVs in A at -2.37 V vs. Fc⁺/Fc.

Figure S106. (A) CVs of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** at variable concentrations, obtained under CO₂ saturation with 2.5 mM Ph₂DBTD. Conditions: 0.1 M TBAPF₆/N,N-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Log-log plot from data obtained from CVs in **A** at -2.21 V vs. Fc⁺/Fc.

Figure S107. (A) CVs where the concentrations of Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and Ph₂DBTD were varied at a fixed 1:5 ratio of **1**:Ph₂DBTD under CO₂ saturation conditions. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (**B**) Loglog plot from data obtained from CVs in **A** at -2.22 V vs. Fc⁺/Fc.

Figure S108. (A) CVs of 1.0 mM Cr(^{tbu}dh^{tbu}bpy)Cl(H₂O) **2** and 2.5 mM Ph₂DBTD at varied CO₂ concentrations. Conditions: 0.1 M TBAPF₆/*N*,*N*-DMF; glassy carbon working electrode, glassy carbon counter electrode, Ag/AgCl pseudoreference electrode; 100 mV/s scan rate; referenced to internal ferrocene standard. (B) Log-log plot from data obtained from CVs in A at -2. 22V vs. Fc⁺/Fc.

As was the case for **1** with TPTD, the variable RM experiment for Mes₂DBTD and Ph₂DBTD was not able to be performed. The co-catalytic effect quickly reached saturation and the irreversible redox feature became obscured by unbound RM in solution.

Controlled Potential Electrolysis Experiments (Aprotic Conditions)

Figure S109. (A) Current versus time trace from CPE experiment with 1+Mes₂DBTD. (B) Charge passed versus time for the CPE experiment shown in A. Conditions were 0.5 mM $Cr(^{tbu}dhbpy)Cl(H_2O)$ 1 and 2.5 mM Mes₂DBTD under a CO₂ atmosphere at -2.30 V vs Fc⁺/Fc in 0.1 M TBAPF₆/*N*,*N*-DMF; working electrode was a glassy carbon rod, counter electrode was a graphite rod, and the reference was a nonaqueous Ag/AgCl pseudoreference electrode; 0.075 M Fc was used as sacrificial oxidant.

Conditions were 0.1 mM $Cr(^{tbu}dh^{tbu}bpy)Cl(H_2O)$ **2** under a CO₂ atmosphere at -2.30 V vs Fc⁺/Fc in 0.1 M TBAPF₆/*N*,*N*-DMF; working electrode was a glassy carbon rod, counter electrode was a graphite rod, and the reference was a nonaqueous Ag/AgCl pseudoreference electrode; 0.075 M Fc was used as sacrificial oxidant.

Figure S116. (A) Current versus time trace from CPE experiment with TPTD under aprotic conditions. (B) Charge passed versus time for the CPE experiment shown in A. Conditions were 2.5 mM TPTD under a CO₂ atmosphere at -2.25 V vs Fc⁺/Fc in 0.1 M TBAPF₆/N,N-DMF; working electrode was a glassy carbon rod, counter electrode was a graphite rod, and the reference was a nonaqueous Ag/AgCl pseudoreference electrode; 0.075 M Fc was used as sacrificial oxidant.

| Time (s) | Charge (coulombs) | moles (e ⁻) | Moles of CO |
|----------|-------------------|-------------------------|-------------|
| 20000* | 8.67 | 8.98 x 10 ⁻⁵ | < LOQ |
| 20000* | 8.67 | 8.98 x 10 ⁻⁵ | < LOQ |
| 20000* | 8.67 | 8.98 x 10 ⁻⁵ | < LOQ |

Table S42. Results from CPE experiment in Figure S111, 2.5 mM TPTD.

Figure S117. (A) Current versus time trace from CPE experiment with Mes₂DBTD under aprotic conditions. (B) Charge passed versus time for the CPE experiment shown in A. Conditions were 2.5 mM Mes₂DBTD under a CO₂ atmosphere at -2.30 V vs Fc⁺/Fc in 0.1 M TBAPF₆/N,N-DMF; working electrode was a glassy carbon rod, counter electrode was a graphite rod, and the reference was a nonaqueous Ag/AgCl pseudoreference electrode; 0.075 M Fc was used as sacrificial oxidant.

| Time (s) | Charge (coulombs) | moles (e ⁻) | Moles of CO |
|----------|-------------------|-------------------------|---------------------|
| 20000* | 6.42 | 6.65 x 10 ⁻⁵ | < LOQ |
| 20000* | 6.42 | 6.65 x 10 ⁻⁵ | <loq< td=""></loq<> |
| 20000* | 6.42 | 6.65 x 10 ⁻⁵ | < LOQ |

Table S43. Results from CPE experiment in Figure S112, 2.5 mM Mes₂DBTD.

Figure S118. (A) Current versus time trace from CPE experiment with Ph₂DBTD under aprotic conditions. (B) Charge passed versus time for the CPE experiment shown in A. Conditions were 2.5 mM Ph₂DBTD under a CO₂ atmosphere at -2.20 V vs Fc⁺/Fc in 0.1 M TBAPF₆/N,N-DMF; working electrode was a glassy carbon rod, counter electrode was a graphite rod, and the reference was a nonaqueous Ag/AgCl pseudoreference electrode; 0.075 M Fc was used as sacrificial oxidant.

| Time (s) | Charge (coulombs) | moles (e ⁻) | Moles of CO |
|----------|-------------------|-------------------------|---------------------|
| 20000* | 8.76 | 9.08 x 10 ⁻⁵ | < LOQ |
| 20000* | 8.76 | 9.08 x 10 ⁻⁵ | <loq< td=""></loq<> |
| 20000* | 8.76 | 9.08 x 10 ⁻⁵ | < LOQ |

Table S44. Results from CPE experiment in Figure S113, 2.5 mM Ph₂DBTD.

Figure S119. (A) Current versus time trace from CPE experiment with 1+Ph₂DBTD. (B) Charge passed versus time for the CPE experiment shown in A. Conditions were 0.5 mM $Cr(^{tbu}dhbpy)Cl(H_2O)$ 1 and 2.5 mM Ph₂DBTD under a CO₂ atmosphere at -2.20 V vs Fc⁺/Fc in 0.1 M TBAPF₆/*N*,*N*-DMF; working electrode was a glassy carbon rod, counter electrode was a graphite rod, and the reference was a nonaqueous Ag/AgCl pseudoreference electrode; 0.075 M Fc was used as sacrificial oxidant.

| Time (s) | Charge (coulombs) | moles (e ⁻) | Moles of CO | FE _{CO} |
|----------|-------------------|-------------------------|-------------------------|-------------------------|
| 20000* | 6.77 | 7.02 x 10 ⁻⁵ | 8.46 x 10 ⁻⁶ | 24.1 |
| 20000* | 6.77 | 7.02 x 10 ⁻⁵ | 8.99 x 10 ⁻⁶ | 25.6 |
| 20000* | 6.77 | 7.02 x 10 ⁻⁵ | 1.02 x 10 ⁻⁵ | 29.2 |

Table S45. Results from CPE experiment in Figure S114, 1:5 (1:Ph₂DBTD).

Figure S120. ¹³C {¹H} NMRs in CD₂Cl₂ for product analysis of CPE solution with 1+Ph₂DBTD. (A) ¹³C {¹H} NMR in CD₂Cl₂ of *N*,*N*-DMF. (B) ¹³C {¹H} NMR in CD₂Cl₂ and *N*,*N*-DMF from prepared sample of TBA⁺[HCO₃]⁻ that was synthesized according to reported procedures.⁴⁷ (C) ¹³C {¹H} NMR in CD₂Cl₂ from the post electrolysis solution of Cr(^{tbu}dhbpy)Cl(H₂O) **1** and Ph₂DBTD in *N*,*N*-DMF under a CO₂ atmosphere at -2.20 V vs. Fc⁺/Fc (Figure S114).

Table S46. Summary of Results from CPE experiments under aprotic conditions (Figures S104-S110, S114 and Tables S35-S40, S44).
