### I. General specification

All reactions were performed using glovebox technique under a dry nitrogen atmosphere unless indicated otherwise. All chemicals unless noted otherwise were purchased from commercial suppliers (TCI, Sigma-Aldrich, CF-Plus chemicals and Nacalai Tesque) and used without purification. Anhydrous solvents were dispensed from an MBRAUN solvent purification system and degassed prior to use. Anhydrous deuterated solvents were purchased from Eurisotop and

stored over 4 Å molecular sieves. Metal precursor  $\text{Ni}(\text{MeCN})_2(\text{C}_2\text{F}_5)_2$  was prepared according to literature procedure<sup>[1]</sup>.

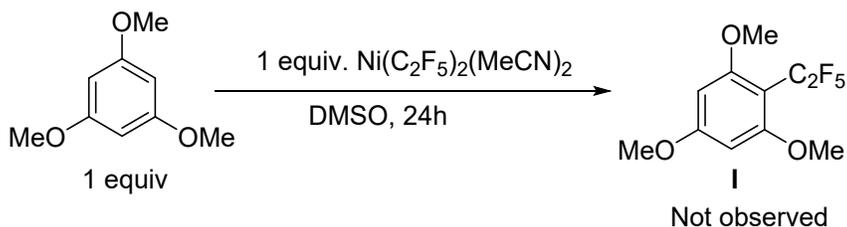

Instrumentation: NMR spectra were measured on JEOL ECZ600R 600MHz, JEOL ECZ400S 400 MHz and Bruker Avance III Neo 500 MHz (CryoProbe) spectrometers. The following abbreviations are used for describing NMR spectra: s (singlet), d (doublet), t (triplet), br. s (broad singlet), vd (virtual doublet), vt (virtual triplet), tq (triplet of quartets), qt (quartet of triplets), br (broad).

Electrospray Ionization High-Resolution Mass Spectrometry (ESI-HRMS) measurements were performed on a Thermo Scientific ETD apparatus.

Absorbance UV/vis spectra were collected using an Agilent Cary 60 instrument.

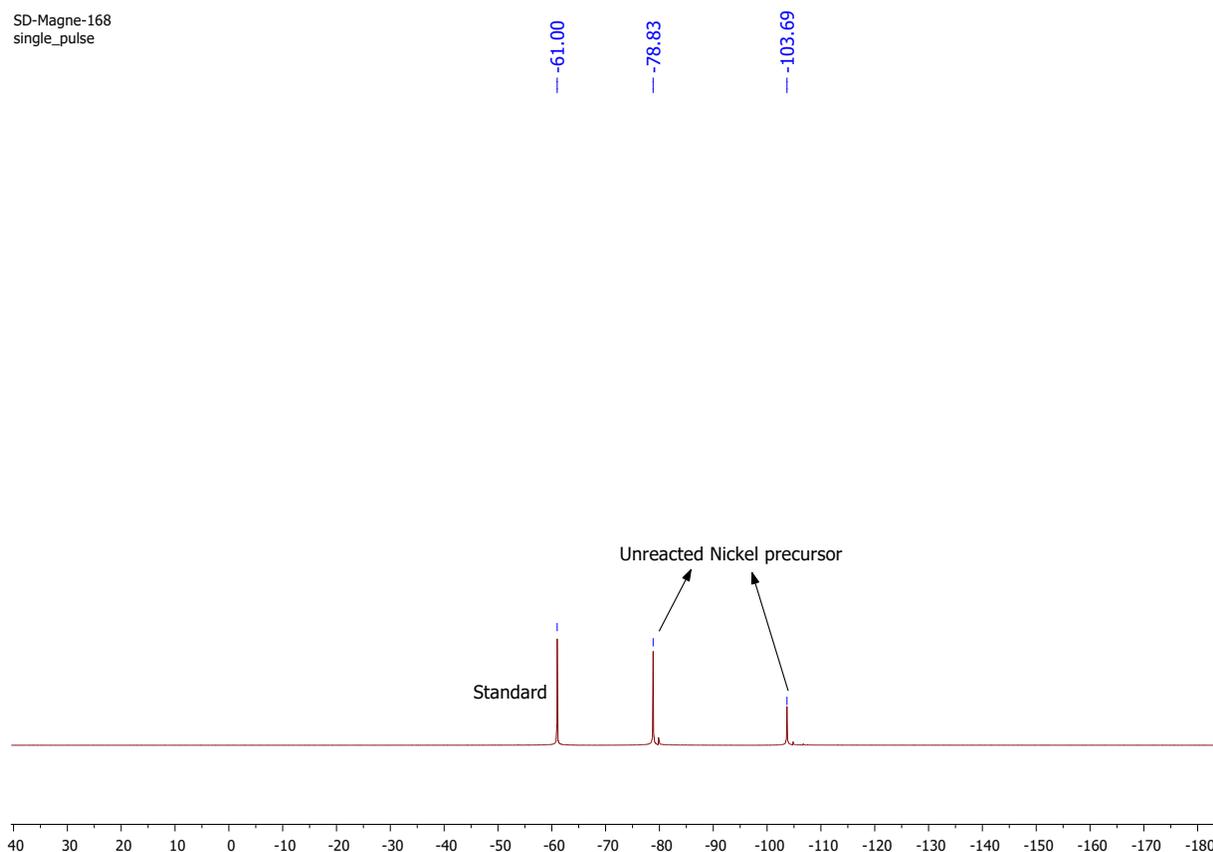

X-band EPR spectra were recorded using X-band JEOL JES-X330 instrument. For low temperature measurements, liquid nitrogen-cooled cryostat was used and the samples were measured in 5 mm diameter quartz tubes; for room temperature samples, 50 µL quartz capillary tubes were used. Simulation of the experimental spectrum were done using the Easyspin package<sup>[2]</sup> in Matlab R2016b. “Pepper” function was used for anisotropic spectra simulation, respectively.

## II. Stoichiometric C-H perfluoro alkylation with Nickel precursor

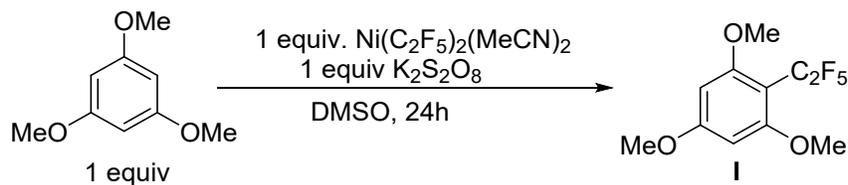

**NMR scale:** A 20 mL vial equipped with a magnetic stirring bar was charged with 1,3,5-Trimethoxybenzene (10.0 mg, 0.059 mmol) and  $\text{Ni}(\text{C}_2\text{F}_5)_2(\text{MeCN})_2$  (22.5 mg, 0.059 mmol), which were then dissolved in anhydrous DMSO (1 mL). Further, the reaction mixture was stirred at room temperature for 24 hours. After the completion of the reaction,  $\alpha,\alpha,\alpha$ -trifluorotoluene (7.3  $\mu\text{L}$ , 0.059 mmol) was added as an internal standard and the yield was determined by  $^{19}\text{F}$  NMR spectroscopy.

### III. Optimization Table for catalytic C-H perfluoro alkylation with Acid Togni II.

**Typical procedure.** Inside the glovebox to a 20 mL vial equipped with a magnetic stirring bar was charged with 1,3,5-Trimethoxybenzene (10.0 mg, 0.059 mmol), 1-pentafluoroethyl-1,2-benziodoxol-3(1H)-one (21.7 mg, 0.059 mmol) and  $\text{Ni}(\text{C}_2\text{F}_5)_2(\text{MeCN})_2$  (2.2 mg, 5.9  $\mu\text{mol}$ ). Then anhydrous DMSO or other solvent (1 mL) was added. The reaction mixture was stirred vigorously at room temperature for 24 hours. After the completion of reaction,  $\alpha,\alpha,\alpha$ -trifluorotoluene (7.3  $\mu\text{L}$ , 0.059 mmol) was added as a standard and the yield was determined by  $^{19}\text{F}$  NMR spectroscopy.

#### IV. Substrate scope for catalytic C-H perfluoro alkylation with Acid Togni II.

**Isolation procedure.** Inside the glovebox, a 20 mL vial equipped with a stirring bar was charged with 1,3,5-Trimethoxybenzene (50.0 mg, 0.30 mmol), 1-pentafluoroethyl-1,2-benziodoxol-3(1H)-

one (108.8 mg, 0.30 mmol) and  $\text{Ni}(\text{C}_2\text{F}_5)_2(\text{MeCN})_2$  (11.2 mg, 0.030 mmol) dissolved in anhydrous DMSO (2.5 mL). The reaction mixture was vigorously stirred for 24 hours. After completion of the reaction, the yellow color reaction mixture was transferred to a separatory funnel outside the glovebox and mixed with ethyl acetate (30 mL) and saturated aqueous NaCl (10 mL). After the first extraction, the organic layer was separated, and remaining water layer was again extracted with ethyl acetate (20 mL). The organic layers were combined and dried over magnesium sulfate. Further the reaction mixture was concentrated under vacuum. The yellow color crude material was then purified by flash column chromatography on silica gel (mobile phase: hexane/ethyl acetate (95:5) as colorless solid (73.1 mg, 86% yield).

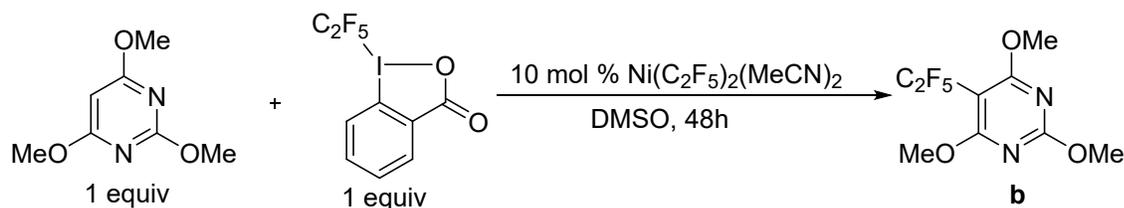

$^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ , 23 °C):  $\delta$  6.14 (s, 2H), 3.84 (s, 3H), 3.81 (s, 6H).

**Isolation procedure.** Inside the glovebox, to a 20 mL vial equipped with a stirring bar was charged with 1-(4-Chlorophenyl)-1H-pyrrole (50.0 mg, 0.281 mmol), 1-pentafluoroethyl-1,2-benziodoxol-3(1H)-one (103.0 mg, 0.281 mmol) and  $\text{Ni}(\text{C}_2\text{F}_5)_2(\text{MeCN})_2$  (10.6 mg, 0.028 mmol), which were then dissolved in anhydrous DMSO (2.5 mL). The reaction mixture was vigorously stirred for 24 hours. After completion of the reaction, the yellow color reaction mixture was transferred to a separatory funnel outside the glovebox and mixed with ethyl acetate (25 mL) and saturated aqueous NaCl (10 mL). After the first extraction, the organic layer was separated, and remaining water layer was again reextracted with ethyl acetate (20 mL). The organic layers were combined and dried over magnesium sulfate. The reaction mixture was concentrated under vacuum. The yellow color crude material was then purified by flash column chromatography on silica gel (mobile phase: hexane/ethyl acetate 60:40) to get **k** as a colorless solid (61.1 mg, 73% yield).

**Isolation procedure.** Inside the glovebox, a 20 mL vial equipped with a stirring bar was charged with Tadalafil (100.9 mg, 0.259 mmol), 1-pentafluoroethyl-1,2-benziodoxol-3(1H)-one (94.8 mg, 0.259 mmol) and  $Ni(C_2F_5)_2(MeCN)_2$  (9.8 mg, 0.026 mmol), which were dissolved in anhydrous DMSO (4 mL). The reaction mixture was vigorously stirred for 48 hours. After completion of the reaction, the yellow color reaction mixture was transferred to a separatory funnel outside the glovebox and mixed with ethyl acetate (30 mL) and saturated aqueous NaCl (20 mL). After the first extraction, the organic layer was separated, and the remaining water layer was again extracted with ethyl acetate (30 mL). The organic layers were combined and dried over magnesium sulfate, and then concentrated under vacuum. The yellow color crude material was then purified by HPLC to give **y** as a yellow color oil (34.7 mg, 26% yield). The compound begins to solidify with time at room temperature. The description of HPLC method: (A) MilliQ water and (B) Acetonitrile-Milli-Q water (90:10), both contained 0.1% formic acid. ## V. Modification of Peptides

Synthesis of peptides were performed under the analogue condition reported by Saze and coworkers in Chapter 6, Plant Epigenetics and Epigenomics – <https://link.springer.com/book/10.1007/978-1-0716-0179-2>.

**Reaction scale:** A 5 mL vial equipped with a magnetic stirring bar was charged with peptide (Tyr-Ala-NH<sub>2</sub>) (6.0 mg, 0.024 mmol), 1-pentafluoroethyl-1,2-benzodioxol-3(1H)-one (26.2 mg, 0.072 mmol) and Ni(C<sub>2</sub>F<sub>5</sub>)<sub>2</sub>(MeCN)<sub>2</sub> (0.9 mg, 0.002 mmol) were dissolved in anhydrous DMSO (1 mL). Further the reaction mixture was stirred at room temperature for 24 hours. After the completion of reaction, the reaction mixture was analyzed by LC-MS.

Note: the nickel precursor was added to the reaction mixture by preparing a stock solution in DMSO.

## VI. Screening of other substrates typical procedure

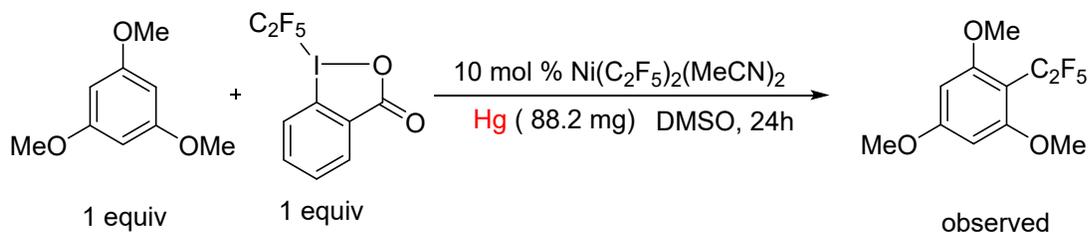

Inside the glovebox to a 20 mL glass vial equipped with a magnetic stirring bar was charged with a substrate, 1-pentafluoroethyl-1,2-benziodoxol-3(1H)-one (1 equiv. relative to substrate) and **1** (10 mol%) in anhydrous DMSO (1 mL). The reaction mixture was stirred at room temperature, for 24-48 h (time depends on substrate). Then  $\alpha,\alpha,\alpha$ -Trifluorotoluene was added as a standard (1 equiv) and the reaction mixtures were analyzed by  $^{19}\text{F}$  NMR spectroscopy.

**Sample Preparation:** A septum vial was charged with 1-trifluoromethyl-1,2-benzodioxol-3(1H)-one (19.7 mg, 0.0624 mmol), Ni(CF<sub>3</sub>)<sub>2</sub>(MeCN)<sub>2</sub> (5.8 mg, 0.0208 mmol) and sealed with electric tape. Further anhydrous acetonitrile (0.5 mL) was added via syringe and the vial was shaken for one-minute, resulting in a green color solution which was analyzed by HRMS.

HRMS (ESI) calculated for C<sub>11</sub>H<sub>7</sub>F<sub>6</sub>INO<sub>2</sub>Ni: m/z 483.8774; found, 483.8770.

## XII. Stability in presence of 2-Iodobenzoic acid.

Inside the glovebox a 20 mL vial was charged with 1-pentafluoroethyl-1,2-benziodoxol-3(1H)-one (Acid- $C_2F_5$  Togni reagent) (6.9 mg, 0.019 mmol) and  $Ni(C_2F_5)_2(MeCN)_2$  (7.2 mg, 0.019 mmol), which dissolved in anhydrous DMSO (2.5 mL). The green color reaction mixture was transferred to a cuvette and a UV-vis spectrum was recorded before the addition of acid. Afterwards, 10 equivalents of 2-Iodobenzoic acid (47.1 mg, 0.190 mmol) were added. Under these conditions, the green color persists throughout the reaction, and the recorded UV-vis spectrum matches those obtained above.

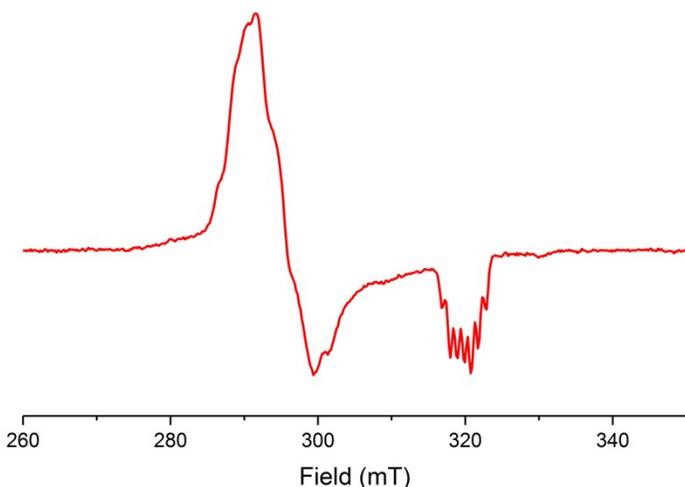

**Figure S76.** UV-Vis spectrum of a reaction mixture **1** with Acid-C<sub>2</sub>F<sub>5</sub> Togni reagent in presence of 10 equivalents of 2-Iodobenzoic acid, measured in DMSO.

### XIII. EPR data.

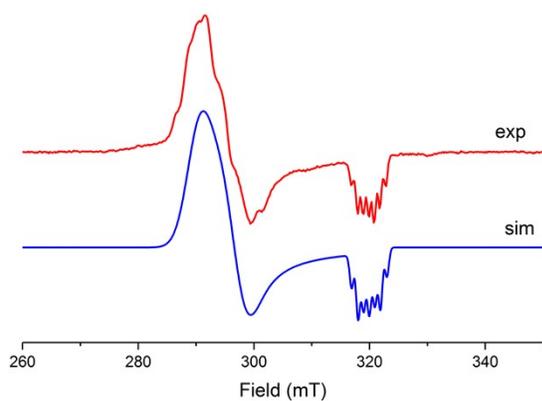

Inside the glovebox a septum vial was charged with 1-pentafluoroethyl-1,2-benziodoxol-3(1H)-one (5.0 mg, 0.014 mmol), Ni(C<sub>2</sub>F<sub>5</sub>)<sub>2</sub>(MeCN)<sub>2</sub> (5.2 mg, 0.014 mmol) and sealed with electric tape. Further the anhydrous acetonitrile (0.50 mL) was added with syringe under ice bath, resulting in a green color solution. The reaction mixture was transferred to another vial and diluted (ca. 1:10) with glassing solvent mixture, PrCN:EtCN (1:1 v/v); the spectrum as recorded at 94 K.

The experimental EPR spectrum (Figure S77) could be satisfactorily simulated as a nearly axial signal with *g* values of 2.23, 2.185, 2.026 (*g*<sub>ave</sub> = 2.147). Splitting along *g*<sub>3</sub> component could be simulated as a superhyperfine splitting from two equivalent F-atoms (*A*<sub>F</sub> = 11.3 G) and one N-atom (*A*<sub>N</sub> = 19.6 G), which gave most satisfactory fit to the experimental data (Figure S78). However, in the absence of direct structural information, an alternative explanation cannot be excluded with *g*<sub>3</sub> component showing superhyperfine splitting from two inequivalent N-atoms, with *A*<sub>N</sub> of 10.7 G and 19.3 G; the resulting spectrum shows similar multiplicity, however,

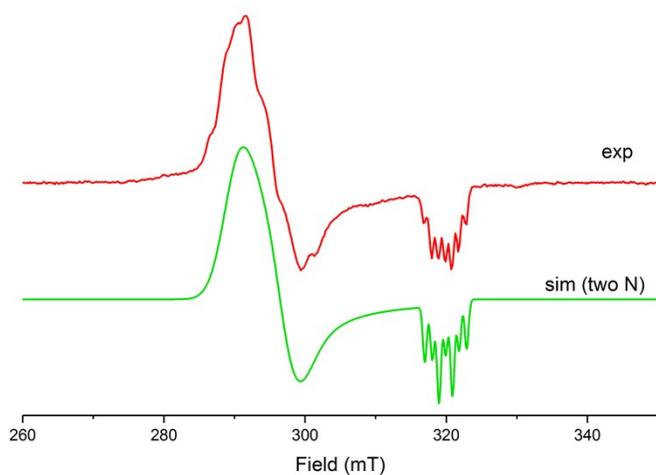

comparison of line intensities was in less satisfactory agreement with experimental results (Figure S79). The splitting along  $g_1$  and  $g_2$  components was not simulated due to significant broadening which was not sufficiently resolved.

(HStrain parametes: 160 for  $g_1$  and  $g_2$ ; 15 for  $g_3$ ).

## XV. X-ray structure determination details.

For compounds **r** and **A2**: data were collected using a Bruker SMART APEX2 area detector diffractometer operating at  $T = 200.00$  K. Data were measured using  $w$  and  $f$  scans with Mo  $K_{\alpha}$  radiation. The unit cell was refined using SAINT V8.40B (Bruker, 2016) Data reduction, scaling and absorption corrections were performed using SAINT V8.40B (Bruker, 2016). SADABS-2016/2 (Bruker, 2016/2) was used for absorption correction.

For compounds **b** and **a2**: Data were collected using a XtaLAB AFC12 (RINC): Kappa dual home/near diffractometer operating at  $T = 100$  K. Data were measured using  $w$  scans with Cu  $K_{\alpha}$  radiation. The diffraction pattern was indexed and the total number of runs and images was based on the strategy calculation from the program CrysAlisPro 1.171.40.54a (Rigaku OD, 2019). Data reduction, scaling and absorption corrections were performed using CrysAlisPro 1.171.40.54a (Rigaku OD, 2019). A multi-scan absorption correction was performed using CrysAlisPro 1.171.40.54a (Rigaku Oxford Diffraction, 2019) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

The structures were solved, and the space group determined by the ShelXT 2018/2 (Sheldrick, 2018) structure solution program using iterative methods and refined by full matrix least squares minimization on  $F^2$  using version 2016/6 of **ShelXL** 2016/6 (Sheldrick, 2015). All non-hydrogen atoms were refined anisotropically. Hydrogen atom positions were calculated geometrically and refined using the riding model. Structures can be found by corresponding CCDC numbers: 2180252 -2180254, 2180257.

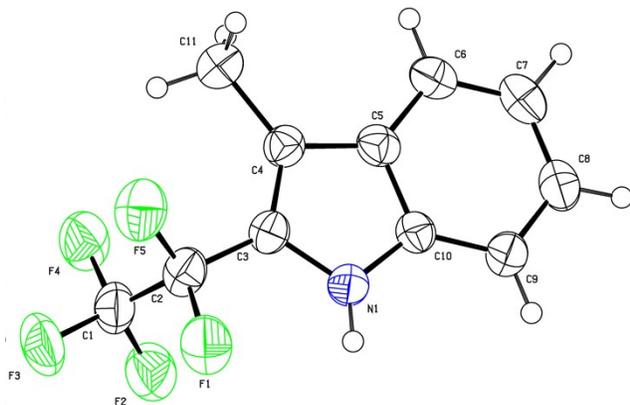

### Compound b

**Experimental.** Single clear-light-colourless plate-shaped crystals of compound **b** were used as supplied. A suitable crystal with dimensions  $0.13 \times 0.12 \times 0.08 \text{ mm}^3$  was selected and mounted on a XtaLAB AFC12 (RINC): Kappa dual home/near diffractometer. The crystal was kept at a steady  $T = 100 \text{ K}$  during data collection. The structure was solved with the **ShelXT** (Sheldrick, 2015) solution program using dual methods and by using **Olex2** 1.5 (Dolomanov et al., 2009) as the graphical interface. The model was refined with **ShelXL** 2016/6 (Sheldrick, 2015) using full matrix least squares minimisation on  $F^2$ .

**Crystal Data.**  $\text{C}_9\text{H}_9\text{F}_5\text{N}_2\text{O}_3$ ,  $M_r = 288.18$ , triclinic,  $P-1$  (No. 2),  $a = 7.9519(6) \text{ \AA}$ ,  $b = 8.3267(6) \text{ \AA}$ ,  $c = 9.1611(7) \text{ \AA}$ ,  $\alpha = 82.449(6)^\circ$ ,  $\beta = 72.420(7)^\circ$ ,  $\gamma = 77.031(6)^\circ$ ,  $V = 562.18(8) \text{ \AA}^3$ ,  $T = 100 \text{ K}$ ,  $Z = 2$ ,  $Z' = 1$ ,  $m(\text{Cu K}\alpha) = 1.623$ , 7514 reflections measured, 2353 unique ( $R_{\text{int}} = 0.0358$ ) which were used in all calculations. The final  $wR_2$  was 0.1326 (all data) and  $R_1$  was 0.0438 ( $I \geq 2 \sigma(I)$ ).

### Compound r

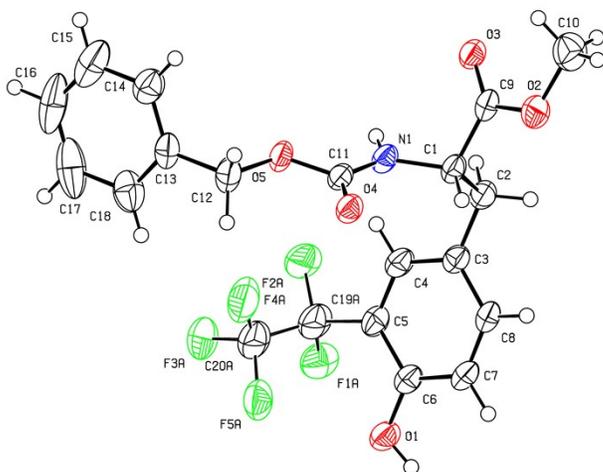

**Experimental.** Single clear-light-colorless block-shaped crystals of compound **r** were used as supplied. A suitable crystal with dimensions  $0.26 \times 0.25 \times 0.23 \text{ mm}^3$  was selected and mounted on a Bruker SMART APEX2 area detector diffractometer. The crystal was kept at a steady  $T = 200.00(10) \text{ K}$  during data collection. The structure was solved with the **ShelXT** 2018/2 (Sheldrick, 2018) solution program using iterative methods and by using **Olex2** 1.5 (Dolomanov et al., 2009) as the graphical interface. The model was refined with **ShelXL** 2016/6 (Sheldrick, 2015) using full matrix least-squares minimization on  $F^2$ .

**Crystal Data.**  $\text{C}_{11}\text{H}_8\text{F}_5\text{N}$ ,  $M_r = 249.18$ , monoclinic,  $P2_1/n$  (No. 14),  $a = 7.8320(7) \text{ \AA}$ ,  $b = 6.1313(5) \text{ \AA}$ ,  $c = 22.4930(17) \text{ \AA}$ ,  $\beta = 93.678(7)^\circ$ ,  $\alpha = \gamma = 90^\circ$ ,  $V = 1077.90(15) \text{ \AA}^3$ ,  $T = 200.00(10) \text{ K}$ ,  $Z = 4$ ,  $Z' = 1$ ,  $m(\text{Mo K}\alpha) = 0.152$ , 9790 reflections measured, 2111 unique ( $R_{\text{int}} =$

### Compound a2

**Experimental.** Single clear-colorless plate-shaped crystals of compound **a2** were used as supplied. A suitable crystal with dimensions  $0.12 \times 0.09 \times 0.01 \text{ mm}^3$  was selected and mounted on a XtaLAB AFC12 (RINC): Kappa dual home/near diffractometer. The crystal was kept at a steady  $T = 100 \text{ K}$  during data collection. The structure was solved with the **ShelXT** (Sheldrick, 2015) solution program using dual methods and by using **Olex2** (Dolomanov et al., 2009) as the graphical interface. The model was refined with **ShelXL** (Sheldrick, 2015) using full matrix least squares minimisation on  $F^2$ .

**Crystal Data.**  $\text{C}_{20}\text{H}_{18}\text{F}_5\text{NO}_5$ ,  $M_r = 447.35$ , monoclinic,  $I2$  (No. 5),  $a = 20.3374(7) \text{ \AA}$ ,  $b = 7.1756(3) \text{ \AA}$ ,  $c = 14.0098(7) \text{ \AA}$ ,  $\beta = 92.999(4)^\circ$ ,  $a = \gamma = 90^\circ$ ,  $V = 2041.69(15) \text{ \AA}^3$ ,  $T = 100 \text{ K}$ ,  $Z = 4$ ,  $Z' = 1$ ,  $m(\text{Cu K}\alpha) = 1.174$ , 11116 reflections measured, 4292 unique ( $R_{\text{int}} = 0.0309$ ) which were used in all calculations. The final  $wR_2$  was 0.1549 (all data) and  $R_1$  was 0.0567 ( $I \geq 2 \sigma(I)$ ).

### Compound A2

**Experimental.** Single clear-light-colorless block-shaped crystals of compound **A2** were used as supplied. A suitable crystal with dimensions  $0.05 \times 0.03 \times 0.03 \text{ mm}^3$  was selected and mounted on a Bruker SMART APEX2 area detector diffractometer. The crystal was kept at a steady  $T = 200.00(10) \text{ K}$  during data collection. The structure was solved with the **ShelXT** 2018/2 (Sheldrick, 2018) solution program using iterative methods and by using **Olex2** 1.5 (Dolomanov et al., 2009) as the graphical interface. The model was refined with **ShelXL** 2016/6 (Sheldrick, 2015) using full matrix least squares minimisation on  $F^2$ .

**Crystal Data.**  $\text{C}_{10}\text{H}_9\text{F}_7\text{N}_2\text{O}_3$ ,  $M_r = 338.19$ , triclinic,  $P-1$  (No. 2),  $a = 8.4543(9) \text{ \AA}$ ,  $b = 8.9233(15) \text{ \AA}$ ,  $c = 9.8274(14) \text{ \AA}$ ,  $\alpha = 111.704(14)^\circ$ ,  $\beta = 98.837(11)^\circ$ ,  $\gamma = 101.362(11)^\circ$ ,  $V = 654.12(17) \text{ \AA}^3$ ,  $T = 200.00(10) \text{ K}$ ,  $Z = 2$ ,  $Z' = 1$ ,  $m(\text{Mo K}\alpha) = 0.189$ , 7895 reflections measured, 2392 unique ( $R_{\text{int}} = 0.1175$ ) which were used in all calculations. The final  $wR_2$  was 0.1834 (all data) and  $R_1$  was 0.0649 ( $I \geq 2 \sigma(I)$ ).

## XVI. Preparation of Nickel precursor $[(\text{CH}_3\text{CN})_2\text{Ni}(\text{C}_3\text{F}_7)]_2$

Inside the glovebox to a 50 mL vial,  $\text{TMSC}_3\text{F}_7$  (0.5 mL, 2.430 mmol) and AgF (312.8 mg, 1.9441 mmol) were added into 30 mL of dry  $\text{CH}_3\text{CN}$ . The reaction mixture was stirred at room temperature for 2 hours. Then  $\text{NiBr}_2 \cdot \text{DME}$  (300 mg, 0.9720 mmol) was added. The reaction mixture was kept stirring for 2 days and filtered. The filtrate was evaporated on a vacuum line to give a yellow solid (83%) yield.

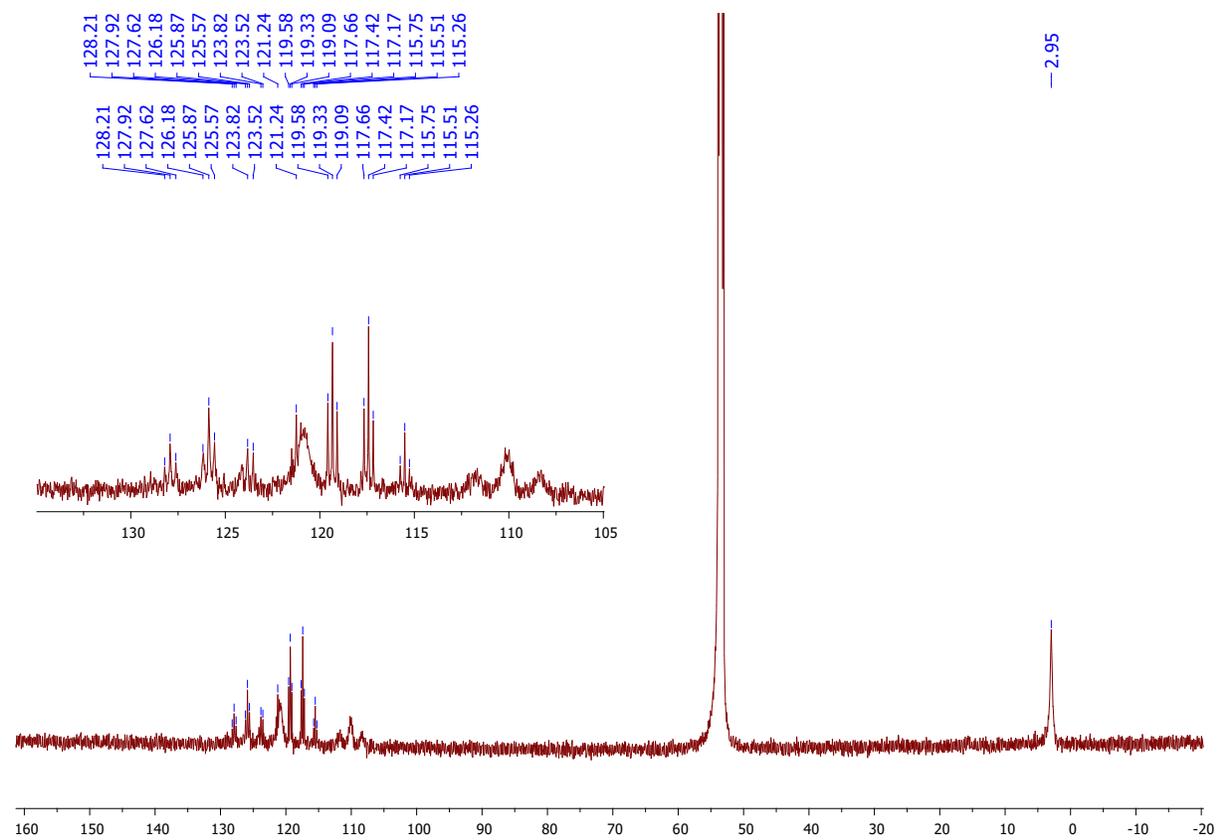

$^1\text{H}$  NMR ( $\text{CD}_2\text{Cl}_2$ , 600 MHz, 23 °C):  $\delta$  2.16 (s, 6H).

$^{13}\text{C}$  NMR ( $\text{CD}_2\text{Cl}_2$ , 151 MHz, 23 °C):  $\delta$  128-107 (complicated fluorine splitting), 2.95.

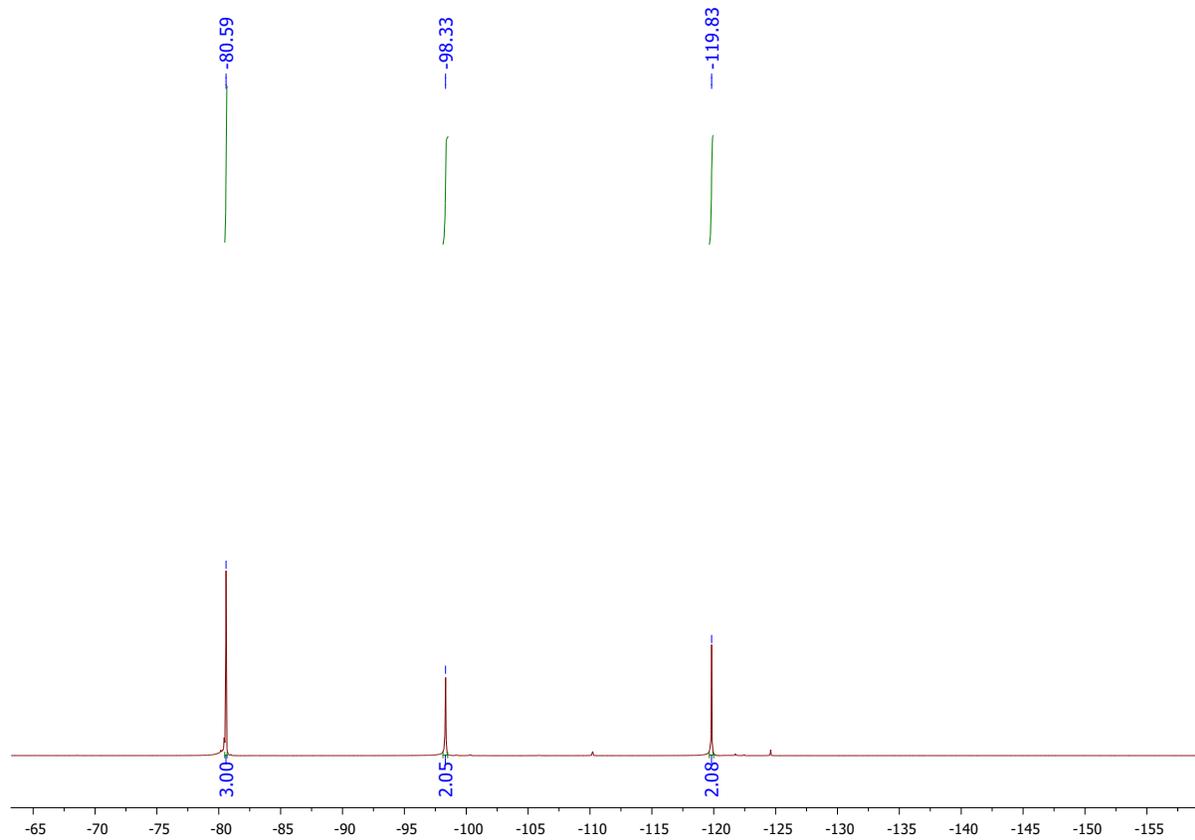

$^{19}\text{F}$  NMR ( $\text{CD}_2\text{Cl}_2$ , 565 MHz, 23 °C):  $\delta$  -80.59 (3F), -98.33 (2F), -119.83 (2F).
