General

All reactions were carried out in oven-dried glassware. All iron–porphyrin catalyzed reactions were carried out with non-dried solvents in an atmosphere of air, unless stated otherwise. All other reactions were carried out with dry solvents in an atmosphere of argon. Dichloromethane, THF, and toluene were dried by using a solvent purification system (MBraun-SPS). All solvents used for flash chromatography were distilled prior to use. Isohexane was additionally filtrated through a silica gel column before use. All chemicals were used as received from commercial sources, unless stated otherwise. Automated flash chromatography was performed on a Büchi Sepacore system equipped with an UV monitor on silica gel (Acros Organics; 0.035–0.070 mm). TLC analysis was performed on TLC plates from Merck (60 F254) with UV light, Cer(IV), or anisaldehyde solution for visualization. Melting points were measured on a Gallenkamp MPD 350 4 melting-point apparatus. UV spectra were recorded on a PerkinElmer 25 UV/Vis spectrometer, shoulders are labelled with sh. Fluorescence spectra were measured on a Varian Cary Eclipse spectrophotometer. IR spectra were recorded on a Thermo Nicolet Avatar 360 FTIR spectrometer by using the attenuated total reflectance (ATR) technique. NMR spectra were recorded on Bruker DRX 500 and Avance III 600 spectrometers. Chemical shifts δ are reported in ppm with the solvent signal as an internal standard. The following abbreviations have been used: s=singlet, d=doublet, t=triplet, q=quartet, quin=quin quintet, spt=septet, m=multiplet, and br=broad. EI mass spectra were recorded by GC-MS coupling on an Agilent Technologies 6890 N GC system equipped with a 5973 mass-selective detector (electron impact= 70 eV). ESI mass spectra were recorded on a Bruker Esquire LC with an ion-trap detector. Positive and negative ions were detected. High Resolution Mass Spectrometry (HRMS) was conducted on a Waters Xevo G2-XS QTOF equipped with a Waters Zspray ESI ionizer. Elemental analyses were measured on a EuroVector EuroEA3000 elemental analyzer. Weight portions are given in percent. High performance liquid chromatography (HPLC) was performed with an Agilent 1100 Series equipped with a Chiralpak IA column (250 mm x 4.6 mm, particle size 5 μm) and a flow rate of 0.6 mL/min at 25 °C. The detection was performed with a diode array UV-Vis detector.

Synthesis of the Fluoro-Substituted Porphyrin Ligands

The following procedure for the synthesis of the β-fluoro-substituted porphyrins H$_2$TPPF$_8$ (3a) and H$_2$TPPF$_{28}$ (3c) represents a modified version of the synthesis of 3,4-difluoropyrrole (2a) and subsequent porphyrin synthesis described by DiMagno et al.$^{1,2}$

**General Procedure I:**

a) 3,3,4,4-Tetrafluoropyrrolidinium chloride (1) (1.0 equiv) was given in a round-bottom Schlenk flask equipped with a magnetic stirring bar and dissolved in dry DMSO (0.1 mL/mg 3,3,4,4-tetrafluoropyrrolidinium chloride) at room temperature. The mixture was cooled to 15 °C in a cold-water bath, then potassium tert-butoxide (4.0 equiv) was slowly added under argon counter flow under constant stirring over a period of 5 minutes. The mixture was stirred for 30 minutes at room temperature, then cooled to 0 °C and quenched by addition of ice water. Due to the reactivity and volatility of the 3,4-difluoro-1H-pyrole (2a), the work up and follow up reaction should be done in rapid succession to ensure reproducibility. After all solids were dissolved, the reaction mixture was neutralized by addition of aqueous HCl (1 M) and extracted six times with dichloromethane. The combined organic layers were washed four times with water and once with brine and dried over magnesium sulfate and diluted with dry dichloromethane until the concentration of the crude product was 0.01 M (assuming quantitative yield). The solution was filtered, transferred to a round-bottom Schlenk flask, equipped with a magnetic stirring bar, and then degassed in an argon stream for 15 minutes.

b) The corresponding benzaldehyde (1.1 equiv) and boron trifluoride diethyl etherate were added under vigorous stirring. The reaction mixture was stirred for the given time at room temperature under argon.

c) Pyridine and DDQ were added and the reaction mixture was stirred overnight at room temperature. The suspension was filtered through a short silica gel column and rinsed with dichloromethane until the eluent became colorless. The obtained crude product was further purified as described below to afford the porphyrins 3a and c.

General Procedure I: a) 1 (400 mg, 2.23 mmol, 1.0 equiv), reaction time: 1 h. b) Benzaldehyde (248 µL, 2.45 mmol, 1.1 equiv), reaction time: 2 h. After addition of BF₃·OEt₂, the reaction mixture turns from yellow to orange and then deep red. c) Pyridine (3.6 mL, 44.6 mmol, 20 equiv), DDQ (658 mg, 2.90 mmol, 1.3 equiv), stirring overnight (black solution and a precipitate was formed). The crude product was washed first three times with isohexane (7 mL), then three times with ethanol (7 mL), and crystallized from toluene/isohexane to provide H₂TPPF₈ (3a) (232 mg, 0.310 mmol, 55%) as violet microcrystals. M.p. >300 °C.

![Image of 3c]

General Procedure I: a) 1 (540 mg, 3.00 mmol, 1.0 equiv), reaction time: 50 min. b) Pentafluorobenzaldehyde (650 mg, 3.30 mmol, 1.1 equiv), BF₃·OEt₂ (1.5 mL, 3.3 mmol, 4.0 equiv), reaction time: 1 h. After addition of BF₃·OEt₂, the reaction mixture turns from colorless to deep red over a period of several minutes. c) Pyridine (4.0 mL, 49.6 mmol, 16.5 equiv), DDQ (690 mg, 3.04 mmol, 1.0 equiv), stirring overnight (black solution and a precipitate was formed), reaction time: 18 h. The reaction mixture was filtered through a pad of silica gel and eluted with
CH2Cl2/MeOH (95:5). The deep purple solution was concentrated under reduced pressure and purified by column chromatography on silica gel with pure pentane as eluent. The first fraction (deep yellow/orange on the column and in diluted solution) afforded **H2TPPF20** (3c) (179 mg, 0.160 mmol, 21%) as dark red/violet crystals after removing the solvent in vacuo. Sometimes, the product was contaminated with a green by-product. In this case, the solid product was washed with cold pentane (3×1.0 mL) until the supernatant turns from deep green to pale yellow affords pure 3c. The product must be dried with care due to its tendency to sublime slowly under reduced pressure.

![Diagram of 5,10,15,20-Tetrakis(pentafluorophenyl)porphyrin (H2TPPF20) (3b)](image)

**Conditions:** This synthesis follows a literature procedure.³ a) 1H-Pyrrole (2b) (268 mg, 4.0 mmol, 1.0 equiv) and pentafluorobenzaldehyde (490 μL, 4.0 mmol, 1.0 equiv) were dissolved in dichloromethane (80 mL) in a round-bottom flask equipped with a magnetic stirring bar. Boron trifluoride diethyl etherate (100 μL, 0.8 mmol, 0.2 equiv) was added slowly. The reaction mixture was stirred at room temperature overnight (during the course of the reaction, the colorless solution changes to deep red). b) Then, pyridine (320 μL, 4.0 mmol, 1.0 equiv) and DDQ (908 mg, 4.0 mmol, 1.0 equiv) were added, and the solution was heated under reflux for 2 h. The reaction mixture was then filtered through a short silica gel column and rinsed with dichloromethane until the eluent became colorless. The solvent was removed in vacuo and the residue was adsorbed on silica gel. The crude product was then purified by column chromatography on silica gel with isohexane/dichloromethane (3:2). After removing the solvent in vacuo, the first fraction afforded H2TPPF20 (3b) (279 mg, 0.310 mmol, 31%) as dark red/violet crystals. M.p. >300 °C; 1H NMR (CDCl3, 500 MHz): δ=−2.92 (s, 2H), 8.92 ppm (s, 8H); 19F NMR: (CDCl3, 282 MHz): δ=−161.93 (td, J=22.9, 7.7 Hz, 8F), −151.83 (t, J=21.4 Hz, 4F), −137.13 ppm(dd, J=23.2, 7.7 Hz, 8F); IR (ATR): ν=3318, 3100, 2919, 2717, 2625, 2539, 1676, 1648, 1558, 1539, 1498, 1482, 1435, 1400, 1342, 1323, 1262, 1246, 1147, 1078, 1044, 984, 917, 831, 806, 770, 754, 723, 698, 636 cm⁻¹; UV/Vis (CH2Cl2): λmax=413, 506, 582 nm; fluorescence (CH2Cl2): λex=392 nm; λem=640, 706 nm; MS (ESI, +10 V): m/z=975.3 [M+H]+; MS (ESI, −50 V): m/z=973.2 [M−H]−. **Synthesis of the Chloro- and μ-Oxo-porphyrin–Iron Complexes**

![Chemical structures](image)

**General Procedure II:**

**a)** The porphyrins 3a–c were placed in a sealed tube equipped with a magnetic stirring bar and suspended in acetonitrile (c = 10 mg/mL). Then, iron(II) chloride (10 equiv) was added and the reaction mixture was stirred for 1.5 h at room temperature under air. Subsequently, the reaction mixture was heated to 120 °C and the suspension turned to a dark but clear solution. After 30 minutes, the mixture was cooled to room temperature. Then, additional iron(II) chloride (10 equiv) was added at room temperature. After 1.5 h, the solution was again heated to 120 °C for 30 minutes. After cooling to room temperature, the solution was diluted with dichloromethane and washed three times with 1 M aqueous HCl. The organic layer was dried over magnesium sulfate and the solvent was removed in vacuo. The crude products were purified by washing to provide the chloro-porphyrin–iron complexes 4a–c.

**b)** The chloro-porphyrin–iron complexes 4a–c were eluted through an activated alumina pad with CH₂Cl₂/MeOH (95:5) under ambient air until the eluent became colorless. The solvent was removed in vacuo to afford the μ-oxo-porphyrin–iron complexes 5b–c.

UV-Vis Spectra of the Porphyrin–Iron Complexes and of the Reaction Mixture of the Oxidative Coupling

All spectra were recorded in a solution of CH$_2$Cl$_2$ (Fig. S1). The reaction mixture was prepared using 50 mol% (FeTPPF$_{28}$)$_2$O (5c) (2.38 mg, 1.00 μmol), 1.0 eq. TfOH (300 μg, 2.00 μmol), and 1.0 eq. N-phenyl-2-naphthylamine (430 μg, 2.00 μmol). The relative intensity of the spectra was set to 1.0 (Soret peak).

Fig. S1 UV-Vis spectra of different iron species proposed for the oxidative coupling reaction (overlayed and single spectra, 230–1000 nm).
Substrate Synthesis

The diarylamines 10a–d were prepared according to our previous report.\(^4\)

3-Hydroxy-1,2-dimethyl-9H-carbazole (13c) (sorazolon E) was published by us previously as an intermediate for the synthesis of 4-deoxycarbazomycin B.\(^5,6\)

9-Methyl-9H-carbazole (15a) was synthesized according to a literature procedure.\(^7\)

9-Benzyl-9H-carbazole (15b)

\]

Sodium hydride (96 mg, 60 wt% in mineral oil, 2.4 mmol) was given in a round-bottom flask equipped with a magnetic stirring bar and then dry DMF (5 mL) was added. A solution of 9H-carbazole (334 mg, 2.00 mmol, 1.0 equiv) in DMF (5 mL) was added slowly to the suspension at 0 °C and the reaction mixture was stirred for 15 min at 0 °C. Then, benzyl bromide (411 mg, 2.40 mmol) was added slowly at 0 °C, and the yellow solution became colorless. After 1 h, water (15 mL) was added to the reaction mixture. The product precipitated as a colorless microcrystalline powder, which was filtrated and washed thoroughly with water and cold ethanol. 15b: Colorless powder, 496 mg (1.93 mmol, 96%) yield. \(^1\)H NMR (600 MHz, CDCl\(_3\)) \(\delta=5.53\) (s, 2H), 7.15 (d, \(J=7.0\) Hz, 2H), 7.21−7.29 (m, 5H), 7.38 (d, \(J=8.2\) Hz, 2H), 7.44 (ddd, \(J=8.1, 7.1, 1.1\) Hz, 2H), 8.14 (d, \(J=7.7\) Hz, 2H). \(^{13}\)C NMR and DEPT (151 MHz, CDCl\(_3\)): \(\delta=46.81\) (CH\(_2\)), 109.13 (2CH), 119.44 (2CH), 120.63 (2CH), 123.26 (2C), 126.08 (2CH), 126.65 (CH), 127.68 (2CH), 129.01 (2CH), 137.42 (C), 140.91 (2C); MS (EI): \(m/z\) (%)=257 (32, M\(^+\)), 180 (5), 166 (15), 152 (4), 140 (12), 91 (100), 65 (13).

**General Procedure III**: The diarylamine 6 or 10 (1.0 equiv), iron catalyst (3.0 mol% chloro- or 1.5 mol% μ-oxo complex), and the additive (20 mol%) were placed in a round-bottom flask equipped with a magnetic stirring bar and dissolved in dichloromethane (c ~ 50 mM). To minimize solvent loss by evaporation a splash head was placed on top of the flask and the reaction mixture was stirred vigorously at room temperature under ambient air. After completion of the reaction (TLC analysis), triethylamine (about 10 equiv) was added. The reaction mixture was filtered through a short pad of silica with dichloromethane as eluent. The solvent was removed in vacuo, and the residue was adsorbed on silica gel. The crude product was purified by column chromatography on silica gel.

**Method 1 (General Procedure III, Lewis acid additive)**: \( N \)-Phenylnaphthalen-2-amine (6) (21.7 mg, 99.0 μmol), \( \text{B(C}_6\text{F}_5)_3 \) (10.3 mg, 20.0 μmol, 20 mol%), \( \text{(FeTPPF}_2\text{)}_2\text{O} \) (5c) (3.6 mg, 15.0 μmol, 1.5 mol%), reaction time: 18 h. Column chromatography: isohexane/dichloromethane (3:1). 7, yield: 80% (17.9 mg, 41.0 μmol); 7% of 6 were reisolated.

**Method 2 (General Procedure III, Bronsted acid additive)**: 6 (21.8 mg, 99.0 μmol), \( \text{TIOH} \) (3.1 mg, 21 μmol, 21 mol%), \( \text{(FeTPPF}_2\text{)}_2\text{O} \) (5c) (3.5 mg, 15.0 μmol, 1.5 mol%), reaction time: 48 h. Column chromatography: isohexane/dichloromethane (3:1). 7, yield: 78% (18.5 mg, 42 μmol); 9, yield: 9% (2.1 mg, 3.0 μmol).

**Method 3 (water-free conditions)**: 6 (21.7 mg, 99 μmol, 1.0 equiv), \( \text{(FeTPPF}_2\text{)}_2\text{O} \) (5c) (3.6 mg, 15.0 μmol, 1.5 mol%) were placed in a Schlenk flask equipped with a magnetic stir bar and a septum. The flask was evacuated and filled with dry air (compressed air dried with calcium chloride), in three repeated cycles. The starting materials were dissolved in dry \( \text{CH}_2\text{Cl}_2 \) (2.5 mL), then \( \text{BF}_3\text{-OEt}_2 \) (2.5 μL, 0.02 mmol, 0.2 equiv) was added. The reaction mixture was stirred vigorously for 5 h. Column chromatography: isohexane/dichloromethane (3:1). 7, yield: 84% (17.9 mg, 41 μmol).

General Procedure III (asymmetric synthesis): 10d (39.6 mg, 100 μmol), (R)-12 (17.9 mg, 21 μmol, 21 mol%), (FeTPPF)$_2$O (5c) (3.6 mg, 1.5 μmol, 1.5 mol%), reaction time: 24 h. Column chromatography: isohexane/dichloromethane 20:1. White solid; 11d, yield: 64% (25.1 mg, 32 μmol), 96% ee.

Chiral HPLC: For the determination of the enantiomeric excess by chiral HPLC, 11d was converted into 11e. 11d (1 mg) was dissolved in THF (50 μL) under an argon atmosphere. A 1M solution of TBAF in THF (20 μL) was added and the mixture was stirred for 5 min at rt. Then, 1M aqueous HCl (0.5 mL) was added and the solution was stirred for another 5 min. The reaction mixture was extracted three times with Et$_2$O (0.2 mL) and the combined organic layers were dried in vacuo to afford the bisphenol 11e, which was dissolved in iPrOH (1.0 mL).

Oxidative C–C Coupling for the Synthesis of 1,1'- and 4,4'-Bicarbazoles

General Procedure IV (Synthesis of 1,1'-Bicarbazoles): Carbazole (1.0 equiv), μ-oxo iron catalyst (FeTPPF$_{28}$)$_2$O (5c) 1.5 mol%) and additive (20 mol%) were placed in a round-bottom flask equipped with a magnetic stirring bar and dissolved in dichloromethane (c ~ 50 mM). To minimize solvent loss by evaporation a splash head was placed on top of the flask. The reaction mixture was stirred vigorously at room temperature under ambient air. The reaction was monitored by TLC analysis. After completion of the reaction, triethylamine (10 equiv) was added. The reaction mixture was then filtered through a short silica pad and rinsed with dichloromethane. The solvent was removed in vacuo and the residue was adsorbed on silica gel. The crude product was purified by column chromatography on silica gel.

Bis-2-hydroxy-3-methylcarbazole (3,3’-Dimethyl-9H,9H-[1,1'-bicarbazole]-2,2'-diol) (14a)

General Procedure IV: 13a (29.5 mg, 0.15 mmol), BF$_3$·OEt$_2$ (4.4 mg, 30 μmol, 20 mol%), (FeTPPF$_{28}$)$_2$O (5c) (5.4 mg, 2.3 μmol, 1.5 mol%), reaction time: 2 h. Column chromatography: isohexane/ dichloromethane/ethyl acetate (7:2:1). Pale yellow/gray solid; 14a, yield: 84% (24.7 mg, 63 μmol); 7% of starting material 13a were reisolated.

General Procedure IV: 13b (34.1 mg, 150 μmol), BF$_3$·OEt$_2$ (4.3 mg, 30 μmol, 20 mol%), (FeTPPF$_{28}$)$_2$O (5c) (5.3 mg, 2.3 μmol, 1.5 mol%), reaction time: 5 h. Column chromatography: isohexane/ dichloromethane/ethyl acetate (7:2:1). Gray solid; 14b, yield: 45% (15.5 mg, 34 μmol). $^1$H NMR (500 MHz, [D$_6$]DMSO): δ=2.43 (s, 6H), 3.81 (s, 6H), 6.82 (d, $J=7.8$ Hz, 2H), 7.03 (t, $J=7.8$ Hz, 2H), 7.60 (d, $J=7.8$ Hz, 2H), 7.86 (s, 2H), 7.95 (s, 2H), 9.31 ppm (s, 2H); $^{13}$C NMR and DEPT (125 MHz, [D$_6$]DMSO): δ=17.64 (2CH$_3$), 55.08 (2CH$_3$), 104.44 (2C), 104.73 (2CH), 111.63 (2CH), 115.96 (2C), 117.57 (2C), 118.94 (2CH), 120.83 (2CH), 124.78 (2C), 129.14 (2C), 139.03 (2C), 145.34 (2C), 152.22 ppm (2C); MS (ESI, +10 V): $m/z$=453.2 [M+H]$^+$; MS (ESI, −50 V): $m/z$=450.9 [M−H]$^−$.

General Procedure V (Synthesis of 4,4'-Bicarbazoles): Carbazole (1.0 equiv), μ-oxo iron catalyst (FeTPPF$_{28}$)$_2$O (5c) (1.5 mol%) and additive (20 mol%) were placed in a round-bottom flask equipped with a magnetic stirring bar and suspended in dichloromethane (c ~ 12.5 mM). To minimize solvent loss by evaporation a splash head was placed on top of the flask and the reaction mixture was stirred vigorously at room temperature under ambient air. After completion of the reaction, the mixture was worked up as described below. The 4,4'-bicarbazoles are very sensitive to oxidation when heated, especially in the presence of traces of iron catalyst. Thus, high temperatures and exposure to air should be minimized during workup.
General Procedure V: Sorazolon E (13c) (29.7 mg, 0.141 mmol), BF$_3$·OEt$_2$ (4.3 mg, 30 μmol, 21 mol%), (FeTPPF)$_2$O (5c) (5.2 mg, 2.2 μmol, 1.6 mol%), CH$_2$Cl$_2$ (12 mL), reaction time: 24 h. Workup: The reaction mixture was filtered through a short silica gel pad and rinsed with dichloromethane. The first fraction (deep red, catalyst) was portioned off and the crude product was then collected. The solvent was degassed and removed under argon atmosphere and reduced pressure. The crude product was adsorbed on silica gel and purified by column chromatography: isohexane/ethyl acetate/MeOH 89:9:2. Brown solid; 14c, yield: 74% (21.9 mg, 52 μmol). (Remark: If the workup is not executed with the appropriate care, an oxidized quinone by-product can be observed as deep brown fraction eluting directly after the desired product. Reduction of this fraction with NaBH$_4$ (excess) in MeOH at rt (10 min affords the desired product 14c.) Oxidative C–C Coupling for the Synthesis of 3,3’-Bicarbazoles

![Chemical Structure](image)

**General Procedure VI (Synthesis of 3,3’-Bicarbazoles):** The N-substituted carbazole 15 (1.0 equiv) and iron catalyst (FeTPPF<sub>28</sub>)<sub>2</sub>O (5c) were placed in a round bottom flask equipped with a magnetic stir bar and suspended in trifluoroacetic acid (TFA). To minimize solvent loss by evaporation a splash head was placed on top of the flask and the reaction mixture was stirred vigorously. Small aliquots of the reaction mixture were neutralized with saturated aqueous K<sub>2</sub>CO<sub>3</sub> and extracted with dichloromethane in a GC vial to monitor the reaction by TLC. After consumption of the starting material, the solution was transferred to a separatory funnel, diluted with water, and then neutralized with saturated K<sub>2</sub>CO<sub>3</sub> solution. The aqueous layer was then extracted three times with dichloromethane. The combined organic layers were washed once with water and with brine and then dried over magnesium sulfate. The crude product obtained after evaporation of the solvent in vacuo was further purified by chromatography on silica gel.

9,9’-Dimethyl-9H,9’H-3,3’-bicarbazole (16a)

**General Procedure VI:** 9-Methyl-9H-carbazole (15a) (18.4 mg, 102 μmol), (FeTPPF<sub>28</sub>)<sub>2</sub>O (5c) (3.5 mg, 1.5 μmol, 1.5 mol%), TFA (2.0 mL), reaction time: 1.5 h. The crude product was adsorbed on silica gel and purified by column chromatography: isohexane/ethyl acetate 9:1. Colorless solid, 82% yield 16a (14.8 mg, 41 μmol). <sup>1</sup>H NMR (600 MHz, [D<sub>6</sub>]DMSO): δ=3.93 (s, 6H), 7.24 (t, J=7.4 Hz, 2H), 7.46–7.52 (m, 2H), 7.61 (d, J=8.2 Hz, 2H), 7.70 (d, J=8.5 Hz, 2H), 7.92 (dd, J=8.5, 1.8 Hz, 2H), 8.29 (d, J=7.6 Hz, 2H), 8.58 (d, J=1.62 Hz, 2H); <sup>13</sup>C NMR and DEPT (151 MHz, [D<sub>6</sub>]DMSO): δ=29.09 (2CH<sub>3</sub>), 109.20 (2CH), 109.22 (2CH), 118.20 (2CH), 118.72 (2CH), 120.47 (2CH), 122.26 (2C), 122.67 (2C), 125.01 (2CH), 125.77 (2CH), 132.25 (2C), 139.71 (2C), 141.09 (2C); MS (ESI, +10 V): m/z=361.2 [M+H]<sup>+</sup>. Wacker-type Oxidation of Olefins

General Procedure VII: Olefin 17a–h (1.0 equiv), FeTPPF_{28}Cl (4c) (5.0 mol%) or (FeTPPF_{28})_2O (5c) (2.5 mol%), and PhSiH_3 were given in a round-bottom flask equipped with a magnetic stirring bar and dissolved in ethanol (c ~ 50 mM). To minimize solvent loss by evaporation, a splash head was placed on top of the flask and the reaction mixture was stirred vigorously at room temperature under ambient air. After completion of the reaction, the mixture was filtered through a short pad of silica, and rinsed with ethyl acetate. The solvent was removed in vacuo and the residue was adsorbed on silica gel. The crude product was purified by column chromatography on silica gel. The ketones 18a, 18d, and 18f–h are less polar than the corresponding alcohols 19a, 19d, and 19f–h; only the ketone 18e is more polar than the corresponding alcohol 19e.
