## **1. General Information**

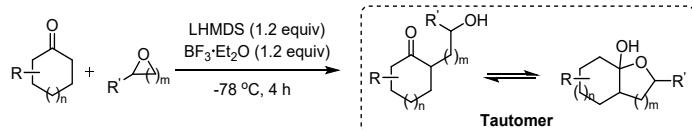

Unless otherwise noted, all reactions were carried out under nitrogen atmosphere, reagents and solvents were obtained from commercial suppliers and were used without further purification. The concentration of HX (aq) are HCl (36%), HBr (40%) and HI (55%-58%). Analytical TLC: aluminum backed plates pre-coated (0.25 mm) with Merck Silica Gel 60F-254. Column chromatography purifications were carried out using 200-300 mesh silica gel. Melting points were measured using open glass capillaries in a SGW® X-4A apparatus.  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra were recorded on a JNM-ECZ400S/L1 400 MHz spectrometer at ambient temperature. Coupling constants are reported in Hz with multiplicities denoted as s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet) and br (broad). Infrared spectra were recorded on a Bruker V 70 and only major peaks were reported in  $\text{cm}^{-1}$ . HRMS were obtained on a WATERS I-Class VION IMS Q-Tof with an ESI source. Compounds were visualized by exposure to UV-light or by dipping the plates in  $\text{KMnO}_4$  stain followed by heating.

## 2. Starting Materials

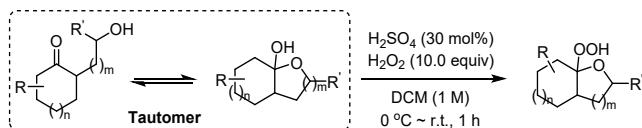

Followed General Procedure for the Synthesis of Hemiketal Hydroperoxides.

### 2.1 General Procedure for the Synthesis of Hemiketal Hydroperoxides<sup>1,3</sup>

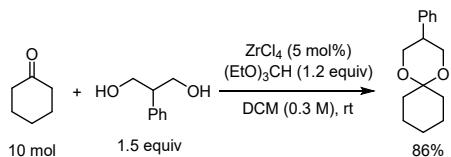

To a stirred solution of LHMDS (1.0 M in THF, 1.2 equiv.) in THF at  $-78^\circ\text{C}$  was added cyclic ketone (10 mmol, 1.0 equiv.) over 5 min. After 1 h, epoxide (3.0 M in THF, 2.0 equiv.) was added to the reaction solution. After 1 h, the  $\text{BF}_3 \cdot \text{Et}_2\text{O}$  (1.2 equiv.) was added very slowly. The reaction mixture was stirred for 2 h at  $-78^\circ\text{C}$  and the reaction was quenched by the addition of saturated aqueous  $\text{NH}_4\text{Cl}$  solution at  $-78^\circ\text{C}$ . Layers were separated and the aqueous layer was extracted with EtOAc. The combined organic layer were washed with brine, dried over  $\text{Na}_2\text{SO}_4$  and concentrated in vacuo. The residue was purified by column chromatography on silica gel (petroleum ether/ethyl acetate = 4:1) to obtain the tautomer of α-hydroxyalkylketones and lactols.

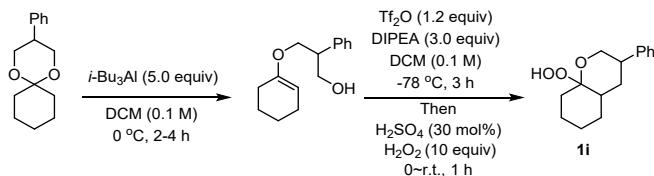

Based on the amount of the tautomer of  $\alpha$ -hydroxyalkylketones and lactols: To a reaction flask was added a solution of  $H_2O_2$  (30% wt in  $H_2O$ , 10.0 equiv.), and conc.  $H_2SO_4$  (30 mol%). Then a solution of the tautomer of  $\alpha$ -hydroxyalkylketones and lactols in DCM (1.0 M) at 0 °C was added. The reaction mixture was stirred for 1 h at room temperature. The aqueous layer was extracted with DCM, the combined organic layer was washed with brine, dried over  $Na_2SO_4$  and concentrated in vacuo. The residue was purified by column chromatography on silica gel (petroleum ether/ethyl acetate = 4:1~10:1) to obtain the hemiketal hydroperoxides.

## 2.2 Synthesis of the Hemiketal Hydroperoxide **1i**<sup>2,3</sup>

To a solution of cyclic ketones (10 mmol) and 2-phenyl-1,3-propanediol (1.5 equiv.), was added  $(EtO)_3CH$  (1.0 M) in dry DCM (0.3 M) and  $ZrCl_4$  (5 mol%). Then, the resulting solution was stirred at room temperature. After completion of the reaction, it was quenched with a cold aqueous solution of NaOH (10%) and the organic layer was separated and the aqueous layer was extracted with DCM. The combined organic layer was washed with brine, dried over anhydrous  $Na_2SO_4$  and concentrated in vacuo. The residue was purified by column chromatography on silica gel (petroleum ether/ethyl acetate = 10:1) to obtain the 3-phenyl-1,5-dioxaspiro[5.5]undecane (2.0 g, 86%).

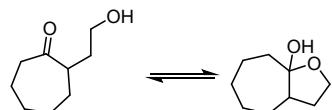

To a cold (0 °C) solution of 3-Phenyl-1,5-dioxaspiro[5.5]undecane (8.6 mmol) in DCM (0.1 M) was added  $i\text{-}Bu_3Al$  (5.0 equiv., 1.0 M in dry toluene). The reaction mixture was stirred at 0 °C for 2-4 h, then, poured into cold 1 N NaOH (aq). The aqueous layer was extracted with DCM, the combined organic layer was washed with brine, dried over  $Na_2SO_4$  and concentrated in vacuo. The residue was purified by column chromatography on silica gel (petroleum ether/ethyl acetate = 10:1~4:1) to obtain the hydroxy vinyl ether (1.5 g, 76%).

The hydroxy vinyl ether (6.5 mmol) was diluted in DCM (0.1 M) and *N,N*-diisopropylethylamine (1.0 M). After cooling to -78 °C, trifluoromethanesulfonic anhydride (1.2 equiv.) was slowly added dropwise to this solution. The reaction mixture was stirred at the same temperature for 3 h. After the reaction completed, the reaction mixture was diluted with DCM and brine, the combined organic layer was washed with brine, dried over  $Na_2SO_4$  and concentrated in vacuo. Then the residue was diluted with DCM in 0 °C, and was added a solution of  $H_2O_2$  (30% wt in  $H_2O$ , 10.0 equiv.), and conc.  $H_2SO_4$  (30 mol%). The reaction mixture was stirred vigorously for 1 h at room temperature. The aqueous layer was extracted with DCM, the combined organic layer was washed with brine, dried over  $Na_2SO_4$  and concentrated in vacuo. The residue was purified by column chromatography on silica gel (petroleum ether/ethyl acetate = 5:1) to obtain the hemiketal hydroperoxides **1i** (0.5 g, 31%); (20%, three steps)

## 2.3 Notes for Starting Materials

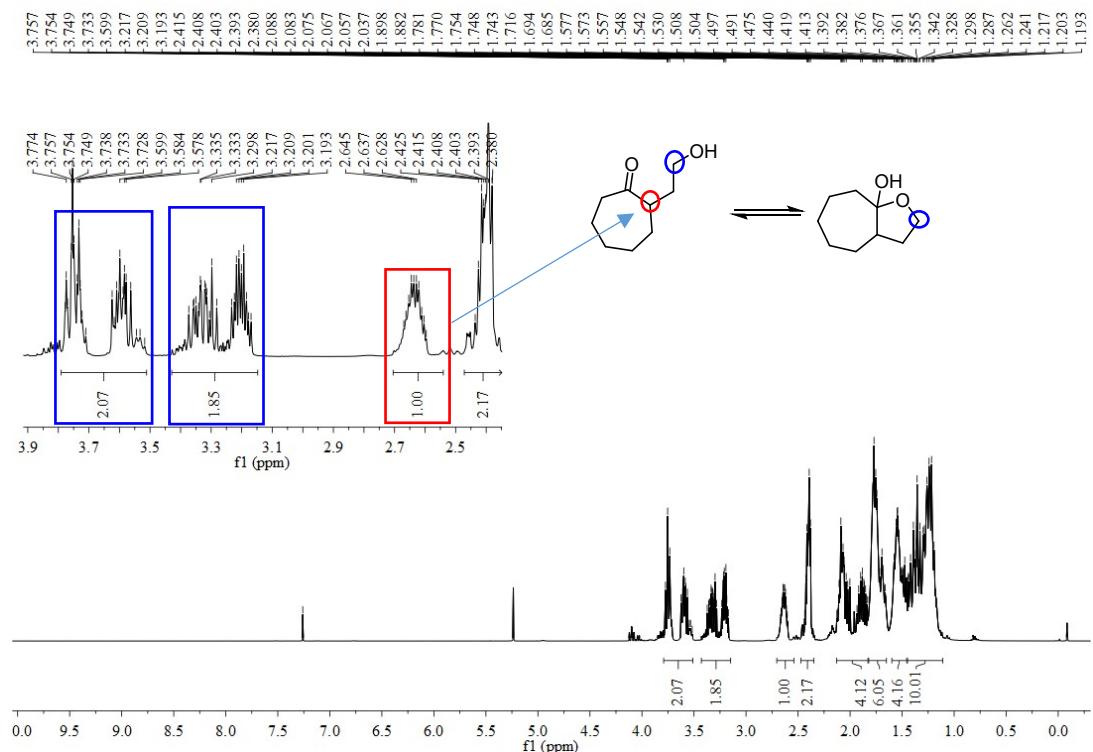

1. These  $\alpha$ -hydroxyalkyl ketones readily tautomerize to the lactols in solution, and the ratio of the two tautomers could be affected easily under acid or basic conditions, concentration, solvent, temperature, and others. This property was also described in these articles: *Tetrahedron*, 1969, **25**, 3157; *Tetrahedron*, 1987, **43**, 3371; *Angew. Chem., Int. Ed.*, 2021, **60**, 5370.

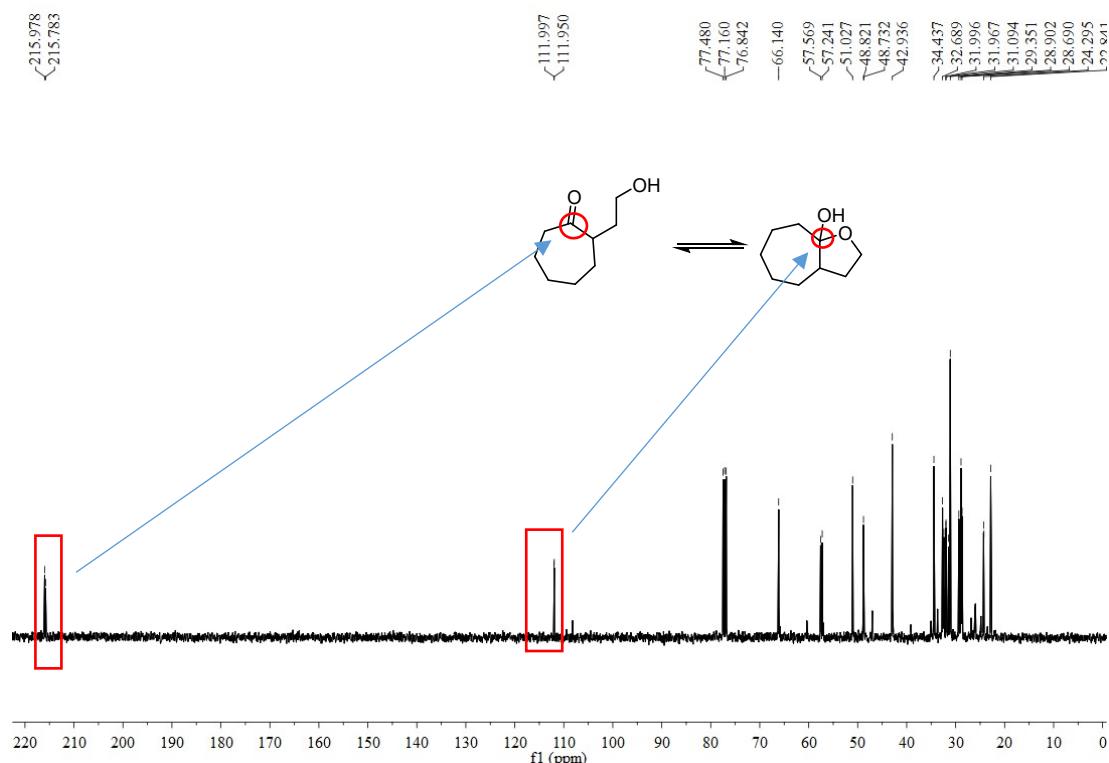

For an example NMR data of automer of  $\alpha$ -hydroxyalkylketone and lactol. The  $^1\text{H}$  NMR spectra showed that the ratio were 2.1:1.9, by comparing the signal areas of protons connected hydroxyl group and protons ether of lactol. Both the ketone carbonyl carbon (216.0, 215.8 ppm) and the tetrasubstituted carbon of lactol (111.99, 111.95 ppm) could be observed in the  $^{13}\text{C}$  NMR spectrum.

$^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ )  $\delta$  3.79 – 3.51 (m, 2H), 3.43 – 3.15 (m, 1.85H), 2.70 – 2.54 (m, 1H), 2.47 – 2.35 (m, 2H), 2.13 – 1.83 (m, 4H), 1.82 – 1.65 (m, 6H), 1.60 – 1.46 (m, 4H), 1.45 – 1.11 (m, 10H).  $^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ )  $\delta$  216.0, 215.8, 112.0, 112.0, 66.1, 57.6, 57.2, 51.0, 48.8, 48.7, 42.9, 34.4, 32.7, 32.5, 32.4, 32.0, 32.0, 31.5, 31.1, 29.4, 29.2, 28.9, 28.7, 24.3, 24.2, 22.8.

$^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) and  $^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ ) spectra of tautomer of  $\alpha$ -hydroxyalkylketones and lactols.

Consider the hemiketal peroxides **1** derived from the mixture of  $\alpha$ -hydroxyalkyl ketones and the lactols are pure and stable. Thus, the hemiketal peroxides **1** characterization and <sup>1</sup>H NMR, <sup>13</sup>C NMR spectral data and IR, HRMS data for these compounds were given.

2. All hemiketal hydroperoxides were heated and concentrated by vacuo at below 30 °C and were stored under -20 °C. We have never experienced a safety problem with these materials.

3. Hydroperoxides are bicyclic fused compounds with an inseparable mixture of *cis-trans* isomers, we have tried our utmost to get cleaner <sup>1</sup>H NMR and <sup>13</sup>C NMR spectra of hydroperoxides.

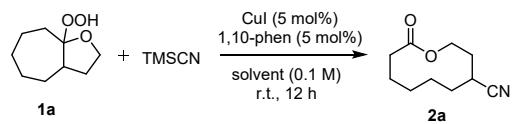

### **3. Optimization of Reaction Conditions**

Subsequently, a solution of hemiketal hydroperoxide **1a** (0.2 mmol, 1.0 equiv.) and nucleophiles (0.3 mmol, 1.5 equiv.) in solvent (2.0 mL) was added by syringe under nitrogen atmosphere. The tube was then sealed and the mixture was stirred at 25 °C for specified time. After the reaction completed, the reaction mixture was concentrated in vacuo and then purified by column chromatography on silica gel to give the target products.

## 7. Investigation of the Reaction Mechanism

### 7.1 Radical Trapping Experiments

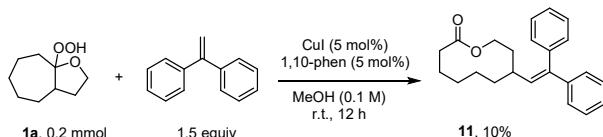

#### (1) Using TEMPO as the radical trapping reagent

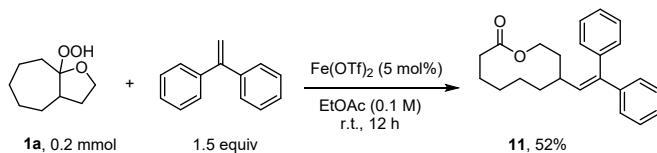

To a 10 mL oven-dried Schlenk-tube equipped with a magnetic stirrer was added CuI (0.01 mmol, 5 mol%), 1,10-phen (0.01 mmol, 5 mol%), and TEMPO (0.4 mmol, 2.0 equiv.). Then, the tube was evacuated and backfilled with nitrogen for three times. Subsequently, a solution of hemiketal hydroperoxide **1a** (0.2 mmol, 1.0 equiv.), and TMSCN (0.3 mmol, 1.5 equiv.) in MeOH (2.0 mL) was added by syringe under nitrogen atmosphere. The tube was then sealed and the mixture was stirred at 25 °C for 10 min. After the reaction completed, it was found that the reaction was totally inhibited and the TEMPO-adduct could be detected by LC-MS (HRMS (ESI) calcd for C<sub>18</sub>H<sub>34</sub>NO<sub>3</sub> [M+H]<sup>+</sup> 312.2533, found 312.2517. These results indicate that a radical intermediate might be involved in this transformation.

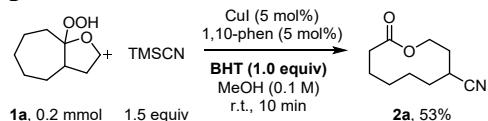

## (2) Using 1,1-diphenylethylene as the radical trapping reagent

To a 10 mL oven-dried Schlenk-tube equipped with a magnetic stirrer was added CuI (0.01 mmol, 5 mol%), 1,10-phen (0.01 mmol, 5 mol%), and 1,1-diphenylethylene (1.5 equiv.). Then, the tube was evacuated and backfilled with nitrogen for three times. Subsequently, a solution of hemiketal hydroperoxide **1a** (0.2 mmol, 1.0 equiv.) in MeOH (2.0 mL) was added by syringe under nitrogen atmosphere. The tube was then sealed and the mixture was stirred at 25 °C for 12 h. After the reaction completed, the reaction mixture was concentrated in vacuo, and then purified by column chromatography on silica gel (petroleum ether/ethyl acetate = 20:1) to give the alkenylated product **11** in 10% yield. This result proved that the reaction probably proceeded *via* a radical pathway. Notably, when the reaction was conducted under the Fe(OTf)<sub>2</sub> catalysis in EtOAc, a 52% yield of **11** could be obtained.

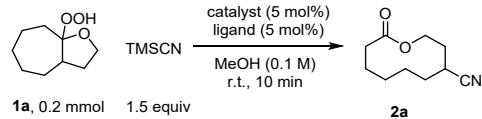

## 7.2 Radical Inhibiting Experiment

To a 10 mL oven-dried Schlenk-tube equipped with a magnetic stirrer was added CuI (0.01 mmol, 5 mol%), 1,10-phen (0.01 mmol, 5 mol%), and BHT (0.2 mmol, 1.0 equiv.). Then, the tube was evacuated and backfilled with nitrogen for three times. Subsequently, a solution of hemiketal hydroperoxide **1a** (0.2 mmol, 1.0 equiv.), and TMSCN (0.3 mmol, 1.5 equiv.) in MeOH (2.0 mL) was added by syringe under

nitrogen atmosphere. The tube was then sealed and the mixture was stirred at 25 °C for 10 min. After the reaction completed, the reaction mixture was concentrated in vacuo, and then purified by column chromatography on silica gel. In this case, the yield of **2a** was reduced to 53%. This result indicates that the reaction might proceed via a radical pathway.

### 7.3 Ligand Effect Experiments

<sup>a</sup>Reaction conditions: **1a** (0.2 mmol, 1.0 equiv.), TMSCN (0.3 mmol, 1.5 equiv.), catalyst (0.01 mmol, 5 mol%),

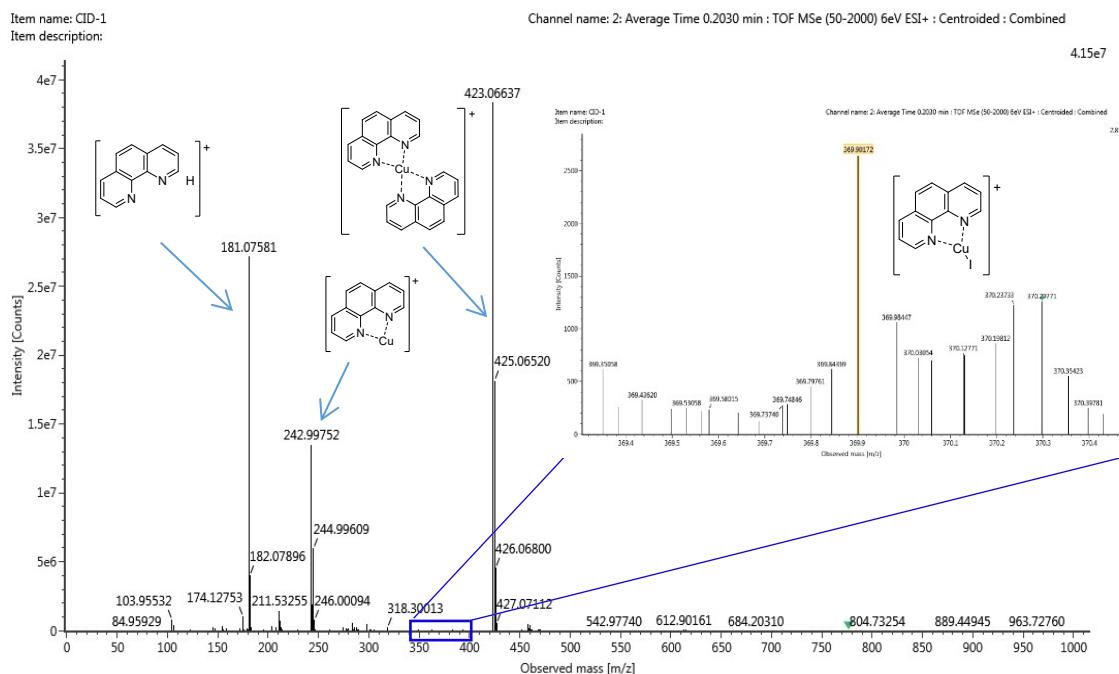

Entry	Catalyst + Ligand (5 mol%)	Yield (%)
1	CuI+1,10-phen	95
2	CuI+2,2'-bpy	70
3	CuI	40
4	CuI·(1,10-phen) complex	77

ligand (0.01 mmol, 5 mol%), and MeOH (2.0 mL) at 25 °C for 10 min under N<sub>2</sub>. Isolated yields.

## 8. Mass Spectrometry Experiments

The experiments were performed with an I-Class VION IMS Q-Tof instrument with an electrospray ion source, it was purchased from the Waters company. The instrument equipped a quadrupole mass filter after ion source for the selection of target ions. In the collision induced dissociation (CID) process, the mass-selected ions enter an argon filled linear ion trap (argon pressure:  $8 \times 10^{-3}$  mbar) after accelerated by electric field. After collision, the ions enter a reflection time-of-flight (TOF) region for determination. For a given ion of interest, its type is defined via mass-to-charge ratio and collision induced dissociation. Collision induced dissociation was also employed to analyze structural fragments.

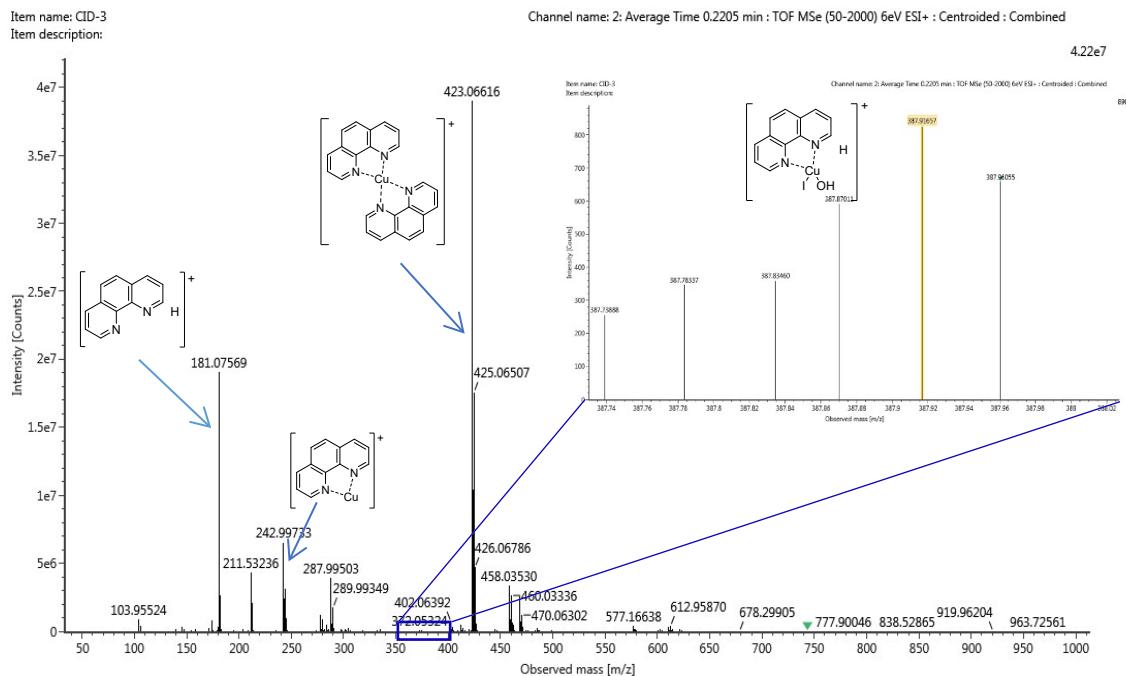

**Proceduer 1.** CuI (0.01 mmol) and 1,10-phen (0.015 mmol) were dissolved in MeOH (1.0 mL), and the mixture was stirred at room temperature for 30 minutes. ## 9. Computational Details

All calculations were carried out with the Gaussian 16 Rev. A.03.<sup>8</sup> Molecular geometry optimizations and frequency calculations were performed by the B3LYP<sup>9</sup> functional with D3(BJ) dispersion correction<sup>10</sup>, which have been proven to be particularly effective in calculating transition metal complexes. Frequency calculations were conducted to determine the stationary points (no imaginary frequencies) and transition state structures (only one imaginary frequency). A mixed basis set of SDD<sup>11</sup> was used for Cu and I, the 6-31G(d)<sup>12</sup> was used for all other atoms. The single point energies were calculated at the B3LYP-D3(BJ)/def2-TZVP<sup>13</sup> level with SMD<sup>14</sup> solvation model (methanol as solvent). All the transition states were confirmed by using the IRC (intrinsic reaction coordinate)<sup>15</sup> calculation. Molecular structure visualizations were generated by using CYL view 1.0<sup>16</sup>.
