## Materials and methods

## General synthetic considerations

Chemicals were purchased from Sigma-Aldrich, Acros, or Alfa Aesar. Anhydrous solvents were purchased from Sigma-Aldrich. TLC was performed on precoated plates (Merck Aluminum sheets silica 60 F254, art No. 5554). Chromatograms were visualised under UV light and by dipping plates into phosphomolybdic acid in EtOH, followed by heating. Flash column chromatography was performed using RediSep Rf disposable silica flash columns on an ISCO CombiFlash Rf automated flash chromatography machine. Ion-pair reverse-phase chromatography was performed on LiChroprep RP-18 (25-40 $\mu \mathrm{m}$, Merck) using a BioLogic LP system (BioRad), eluting at $5 \mathrm{~mL} / \mathrm{min}$ with a gradient of $0-10 \% \mathrm{MeCN}$ in 0.05 M triethylammonium bicarbonate (TEAB) buffer, collecting 7 mL fractions. Fractions containing the target polyphosphate were identified using a qualitative Briggs phosphate assay (as described by Lampe et al. ${ }^{1}$ ).

Proton ${ }^{1} \mathrm{HNMR}$ and COSY spectra were recorded on a Bruker Avance III ( 400 MHz ) spectrometer. Proton chemical shifts are reported in ppm ( $\delta$ ) relative to internal tetramethylsilane (TMS, $\delta 0.0 \mathrm{ppm}$ ) or with the solvent reference relative to TMS employed as the internal standard ( $\mathrm{CDCl}_{3}, \delta 7.26 \mathrm{ppm} ; \mathrm{CD}_{3} \mathrm{OD}, \delta 3.31 \mathrm{ppm}$ ). The following abbreviations are used to describe the multiplicity of the chemical shifts: s , singlet; d , doublet; t , triplet; dd, double doublet; q, quartet; m, multiplet; br, broad. ${ }^{13}$ CNMR and HSQC spectra were recorded on a Bruker Avance III ( 100 MHz ) spectrometer with complete proton decoupling. Carbon chemical shifts are reported in ppm ( $\delta$ ) relative to TMS with the respective solvent resonance as the internal standard ( $\mathrm{CDCl}_{3}, \delta$ $77.0 \mathrm{ppm}, \mathrm{d} 4-\mathrm{MeOH}, \delta 49.0 \mathrm{ppm}$ ). ${ }^{31} \mathrm{PNMR}$ spectra were recorded on a Bruker Avance III ( 162 MHz ) spectrometer with complete proton decoupling (unless explicitly labelled as proton-coupled). Phosphorus chemical shifts are reported in ppm ( $\delta$ ) relative to an $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}$ external standard $\left(\mathrm{H}_{3} \mathrm{PO}_{4}, \delta 0.0 \mathrm{ppm}\right)$. All NMR data were collected at $25^{\circ} \mathrm{C}$. Melting points were determined using a Stanford Research Systems Optimelt MPA100 automated melting point system and are uncorrected. Mass spectra were recorded on a GC-MS (Agilent 7200). All reactions were carried out under an argon atmosphere employing oven-dried glassware, unless stated otherwise.

## Luminescence experiments

Luminescence spectra were recorded on a Camlin Photonics luminescence spectrometer with FluoroSENS version 3.4.7.2024 software. Emission spectra were obtained using a $40 \mu \mathrm{~L}$ or $100 \mu \mathrm{~L}$ Hellma Analytics quartz cuvette (Art no. 111-10-K-40). Excitation light was set at 322 nm and emission recorded in the range 400 720 nm using an integration time of 0.5 seconds, increment of 1.0 nm , excitation slit of 0.2 nm and emission slit of 0.5 nm . Emission lifetime measurements were performed on the FluoroSENS instrument. Measurements were taken of 1 mL of 0.1 absorbance samples of Eu(III) complexes in 10 mM HEPES at pH 7.0, unless stated otherwise. Measurements were obtained by indirect excitation of the Eu(III) ion via the quinoline antennae using a short pulse of light at 322 nm followed by monitoring the integrated intensity of the light emitted at

615 nm , with 500 data points collected over a 10 millisecond time period. The decay curves were plotted in Origin Labs 2019 version 9.6.0.172, and fitted to the equation:

$$
\mathrm{I}=\mathrm{A}_{0}+\mathrm{A}_{1} e^{-k t}
$$

where $I$ is the intensity at time, $t$, following excitation, $\mathrm{A}_{0}$ is the intensity when decay has ceased, $\mathrm{A}_{1}$ is the preexponential factor and k is the rate constant for the depopulation of the excited state.

The hydration state, $q$, of the Eu(III) complexes was determined using the modified Horrocks equation: ${ }^{2}$

$$
q(\mathrm{Eu})=1.2\left(1 / \tau_{\mathrm{H} 2 \mathrm{O}}-1 / \tau_{\mathrm{D} 2 \mathrm{O}}-0.25-0.075 \mathrm{n}\right)
$$

where $\tau_{\mathrm{H} 20}$ and $\tau_{\mathrm{D} 20}$ are the emission lifetime times in water and $\mathrm{D}_{2} \mathrm{O}$, respectively, and n is the number of carbonyl-bound amide NH groups.

## Anion binding titrations

Anion binding titrations were carried out in degassed 10 mM HEPES buffer at pH 7.0 . Stock solutions of anions (e.g. hydrogen phosphate, AMP) containing Eu(III) complex ( $5 \mu \mathrm{M}$ ) were made up at $0.4,4$ and 40 mM anion. The appropriate anion stock solution was added incrementally to $100 \mu \mathrm{~L}$ of Eu(III) complex ( $5 \mu \mathrm{M}$ ) and the emission spectrum was recorded after each addition. The ratio of emission bands 605-630 nm/585-600 $\mathrm{nm}(\Delta I=2 / \Delta J=1)$ was plotted as a function of anion concentration. The data were analysed using a nonlinear least-squares curve fitting procedure, based on a 1:1 binding model described by the equation:

$$
\mathrm{FB}=\frac{\frac{1}{\mathrm{~K}_{\mathrm{a}}}+[\mathrm{A}]+[\mathrm{Eu}]-\sqrt{\left(\frac{1}{\mathrm{~K}_{\mathrm{a}}}+[\mathrm{A}]+[\mathrm{Eu}]\right)^{2}+4[\mathrm{~A}][\mathrm{Eu}]}}{2[\mathrm{Eu}]}
$$

where FB is the fraction bound, calculated by $\left(I-I_{0}\right) /\left(\mathrm{I}_{1}-\mathrm{I}_{0}\right)$ where I is the emission intensity at $[\mathrm{A}], \mathrm{I}_{0}$ is the initial emission intensity, and $\mathrm{I}_{1}$ is the final emission intensity. [A] is the total concentration of anion in solution, $[\mathrm{Eu}]$ is the total concentration of $\mathrm{Eu}(\mathrm{III})$ complex, $K_{\mathrm{a}}$ is the apparent binding constant.

## Computational details

Geometry optimisations were performed at the DFT level using the $\omega$ B97M-V functional along with the $6-31 G^{*}$ basis set. ${ }^{3,4}$ A large-core quasi-relativistic effective core potential (ECP) ${ }^{5}$ was used for treating the core along with the $4 f^{6}$ shell of $\mathrm{Eu}(\mathrm{III})$ and the associated $(7 \mathrm{~s} 6 \mathrm{p} 5 \mathrm{~d}) /[5 \mathrm{~s} 4 \mathrm{p} 3 \mathrm{~d}]$ basis set was used for the valence electrons. All computations were performed using spin-restricted orbitals using a pseudo-singlet configuration. Solvation in water was modelled using Truhlar's SMD model. ${ }^{6}$ These geometry optimisations were carried out in Q-Chem 5.4. ${ }^{7}$

Additional single-point computations were performed in Orca $5.0^{8}$ using again the SMD solvent model and $\omega \mathrm{B} 97 \mathrm{M}-\mathrm{V}$ functional but with the larger def2-TZVP basis set (long with the def2 ECP) and the gCP correction for basis-set superposition error.9,10 These computations replaced the Eu ${ }^{3+}$ atom with $\mathrm{Y}^{3+}$ (possessing a similar atomic radius) to avoid open-shell f-electrons. The free energies of solvation from these computations are reported in the main text. No further thermostatistical corrections were carried out.

Emission spectra were simulated using the $a b$ initio complete active space self-consistent field (CASSCF) level of theory. These computations employed the ANO-RCC-VTZP basis set for the Eu atom, ANO-RCC-VDZP for heteroatoms, and ANO-RCC-VDZ for C/H atoms. ${ }^{11}$ The active space consisted of the 6 f -electrons distributed over the 7 f -orbitals. CASSCF orbital optimizations were performed by averaging over 7 states (making up the full CAS $(6,7)$ heptet configuration space). Using these orbitals, CASCI computations on quintets (15 roots), triplets (10 roots), and singlets (5 roots). Heptets, quintets, triplets, and singlets were combined in a spin-orbit state interaction procedure (SO-RASSI) to produce the final spin-orbit coupled states. ${ }^{12}$ Emission spectra were computed with respect to the ${ }^{5} \mathrm{D}_{0}$ state, i.e. the 50 th state in the spin-orbit expansion. Oscillator strengths for the quadropole allowed $\Delta \mathrm{J}=1$ states were fixed at a value of $10^{-8}$ whereas the oscillator strengths for all other states were computed via transition dipole moments in the length representation. To match the results closer to the experimental spectra, energies were shifted down by 0.4 eV . Reduced molecular models were used to make these computations feasible: the inositol phosphate in monodentate/bidentate binding mode was replaced with phosphate/pyrophosphate; functional groups of the macrocyclic ligand not bound to Eu were removed. Spectra are shown with a phenomenological broadening of 0.015 eV . These CASSCF calculations were carried out in OpenMolcas. ${ }^{13}$

The underlying computational research data (molecular structures and input/output files of Q-Chem, Orca and OpenMolcas) are provided via separate repository, DOI: 10.17028/rd.lboro.21666218.

## Synthesis of 5-diphosphoinositol pentakisphosphate (5-PP-InsP ${ }_{5}$ )

## 2-O-Benzyl-1,6:3,4-bis-O-(2,3-dimethoxybutane-2,3-diyl)-myo-inositol (3)

As described by Wang et al., ${ }^{14}$ sodium hydride ( $149 \mathrm{mg}, 5.88 \mathrm{mmol}, 1.2$ equiv) was added over 10 minutes to a suspension of 1,6:3,4-bis- 0 -(2,3-dimethoxybutane-2,3-diyl)-myo-inositol (synthesised as described by Riley et al., $\left.{ }^{15} 2.00 \mathrm{~g}, 4.90 \mathrm{mmol}\right)$ in dry DMF ( 120 mL ) under argon. After an hour of stirring at RT, benzyl bromide ( $0.64 \mathrm{~mL}, 5.39 \mathrm{mmol}, 1.1$ equiv) was added slowly over 30 minutes. The reaction mixture was then allowed to stir at RT for 20 h . Completion of the reaction was confirmed with TLC, before the excess sodium hydride was destroyed through the dropwise addition of $\mathrm{MeOH}(10 \mathrm{~mL})$. The solution was concentrated in vacuo and the
residue dissolved in DCM ( 200 mL ). The organic layer was washed with water ( 200 mL ) and brine ( 200 mL ), before being dried over $\mathrm{MgSO}_{4}$ and concentrated. The crude product was purified by flash chromatography (P.E.-EtOAc, $0-100 \%$ ) to give the pure product as a white solid ( $1009.9 \mathrm{mg}, 2.03 \mathrm{mmol}, 41 \%$ yield). m.p. 207.9$212.0^{\circ} \mathrm{C}$ (lit. ${ }^{15} 214-216^{\circ} \mathrm{C}$ ); ${ }^{1}{ }^{\text {HNMR }}\left(\mathrm{CDCl}_{3}, 400 \mathrm{~Hz}\right.$ ): 7.53-7.51 (m, 2H, Ar), 7.34-7.23 (m, 3H, Ar), $4.87(\mathrm{~s}, 2 \mathrm{H}$, $\left.\mathrm{CH}_{2} \mathrm{Ar}\right), 4.08(\mathrm{t}, J=9.9 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}-4$ and $\mathrm{H}-6), 3.82(\mathrm{t}, J=2.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2), 3.67(\mathrm{t}, J=9.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-5), 3.54(\mathrm{dd}, J=$ $2.5,10.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}-1$ and $\mathrm{H}-3), 3.28\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{OCH}_{3}\right), 3.23\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{OCH} \mathrm{H}_{3}\right), 2.46(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 1.32\left(\mathrm{~s}, 12 \mathrm{H}, \mathrm{CCH}_{3}\right)$; ${ }^{13}$ CNMR ( $\mathrm{CDCl}_{3}, 100 \mathrm{~Hz}$ ): $139.8(\mathrm{Ar}), 128.0(\mathrm{Ar}), 127.8(\mathrm{Ar}), 127.1(\mathrm{Ar}), 99.8\left(\mathrm{CCH}_{3}\right), 99.3\left(\mathrm{CCH}_{3}\right), 76.4(\mathrm{C}-2)$, $74.0\left(\mathrm{CH}_{2} \mathrm{Ar}\right), 70.8(\mathrm{C}-5), 69.5(\mathrm{C}-4$ and $\mathrm{C}-6), 69.3\left(\mathrm{C}-1\right.$ and C-3), $48.1\left(\mathrm{OCH}_{3}\right), 48.0\left(\mathrm{OCH}_{3}\right), 17.9\left(\mathrm{CCH}_{3}\right), 17.8$ $\left(\mathrm{CCH}_{3}\right)$; HRMS (ESI): $m / z$ calcd $[\mathrm{M}+\mathrm{Na}]^{+}$for $\mathrm{C}_{25} \mathrm{H}_{38} \mathrm{O}_{10}$ : 521.2357, found: 521.2359 .

## $N, N$-Diisopropylamino-bis-[2-(methylsulfonyl)ethyloxy]phosphine (4)

In a version of the method described by Engelsma et al., ${ }^{16}$ trichlorophosphane ( $0.50 \mathrm{~mL}, 5.73 \mathrm{mmol}$ ) was added to a solution of DIPEA ( $2.00 \mathrm{~mL}, 11.46 \mathrm{mmol}, 2$ equiv) in dry DCM ( 20 mL ) under argon. This solution was then cooled to $0^{\circ} \mathrm{C}$ before diisopropylamine ( $1.63 \mathrm{~mL}, 11.46 \mathrm{mmol}, 2$ equiv) was added. The reaction mixture was allowed to stir for 10 min at $0^{\circ} \mathrm{C}$. Methylsulfonylethanol ( $1.42 \mathrm{~g}, 11.46 \mathrm{mmol}, 2$ equiv) dissolved in dry DCM ( 30 mL ) was then added dropwise to the reaction. The mixture was allowed to warm to RT and left to stir for 3 h . The completion of the reaction was determined by ${ }^{31}$ PNMR (diagnostic product signal at 149 $\mathrm{ppm})$. The reaction mixture was then diluted with EtOAc ( 200 mL ), washed with sat. sodium bicarbonate (100 mL ) and brine ( 100 mL ). The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo to yield the crude product as a yellow oil. The crude product was purified by flash chromatography (column deactivated with $1 \%$ TEA in PE prior to use, petroleum ether and EtOAc, 30 to 100\%) and then recrystallized (minimum amount of DCM, approx. 2 mL , and then 150 mL diethyl ether) to give the pure product as a white, crystalline solid ( $1060 \mathrm{mg}, 2.81 \mathrm{mmol}, 49 \%$ yield). m.p. $73.3-74.1^{\circ} \mathrm{C}$ (lit. value ${ }^{17} 75.5-77.0^{\circ} \mathrm{C}$ ); ${ }^{1} \mathbf{H N M R}\left(\mathrm{CDCl}_{3}, 400 \mathrm{~Hz}\right.$ ): 4.13$4.03\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 3.61-3.55\left[\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right], 3.29-3.25\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 3.00\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SCH}_{3}\right), 1.20[\mathrm{~s}, 6 \mathrm{H}$, $\left.\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right], 1.18\left[\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right] ;$ 31 PNMR $\left(\mathrm{CDCl}_{3}, 162 \mathrm{~Hz}\right): 149.06 ;{ }^{13} \mathbf{C N M R}\left(\mathrm{CDCl}_{3}, 100 \mathrm{~Hz}\right): 57.8\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)$,
 $\left.\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right], 24.7$ [s, 6H, $\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}$ ]; HRMS (ESI): $\mathrm{m} / \mathrm{z}$ calcd [M+Na] for $\mathrm{C}_{12} \mathrm{H}_{28} \mathrm{NO}_{6} \mathrm{PS}_{2}$ : 400.1007, found: 400.0996.

## 2-O-Benzyl-1,6:3,4-bis-O-(2,3-dimethoxybutane-2,3-diyl)-myo-inositol-5-bis[2(methanesulfonyl)ethyl]phosphate (5)

2-O-Benzyl-1,6:3,4-bis-O-(2,3-dimethoxybutane-2,3-diyl)-myo-inositol (3, $909 \mathrm{mg}, 1.82 \mathrm{mmol}$ ) was dissolved in dry DCM ( 18 mL ) and the solution put under argon. To this, 5 -phenyl- $1 H$-tetrazole ( $400 \mathrm{mg}, 2.73 \mathrm{mmol}, 1.5$ equiv.) followed by $N, N$-diisopropylamino-bis-[2-(methylsulfonyl)ethyloxy]phosphine ( $\mathbf{1}, 826 \mathrm{mg}, 2.19 \mathrm{mmol}$, 1.2 equiv) were added. The reaction mixture was allowed to stir at RT for 16 h . Prior to oxidation, the reaction was analysed by ${ }^{31} \mathrm{PNMR}$ spectroscopy to confirm that phosphitylation had been successful. The reaction mixture was then cooled to $-78^{\circ} \mathrm{C}$, before $m \mathrm{CPBA}$ ( $900 \mathrm{mg}, 70 \%$ pure, $3.65 \mathrm{mmol}, 2.0$ equiv) was added. The solution was allowed to warm to RT and was then diluted with EtOAc ( 150 mL ). This organic phase was washed with $10 \%$ sodium sulphite solution ( $3 \times 20 \mathrm{~mL}$ ), dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo to yield the crude product. The product was purified by flash chromatography (EtOAc-MeOH, $0-20 \%$ ) and the pure product collected as a white foam ( $1339 \mathrm{mg}, 1.69 \mathrm{mmol}, 93 \%$ yield). ${ }^{1} \mathbf{H N M R}\left(\mathrm{CDCl}_{3}, 400 \mathrm{~Hz}\right.$ ): 7.44-7.42 (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.27-2.17 (m, 3H, Ar), 4.77 ( $\mathrm{s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Ar}$ ), 4.60-4.57 (m, 2H, MSE CH ${ }_{2}$ ), 4.53-4.48 (m, 2H, MSE CH ${ }_{2}$ ), $4.33(\mathrm{q}, J=9.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-5), 4.11(\mathrm{t}, J=9.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}-4$ and $\mathrm{H}-6), 3.75(\mathrm{~s}, 1 \mathrm{H}, \mathrm{H}-2), 3.50(\mathrm{~d}, J=10.0 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}-1$ and H-3), 3.45-3.39 (m, 2H, MSE CH2), 3.30-3.26 (m, 2H, MSE CH 2 ), $3.19\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{OCH}_{3}\right), 3.15\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{OCH}_{3}\right), 2.94$ ( $\mathrm{s}, 6 \mathrm{H}, \mathrm{SCH}_{3}$ ), $1.24\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CCH}_{3}\right), 1.20\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CCH}_{3}\right) ;{ }^{31} \mathrm{PNMR}^{\left(\mathrm{CDCl}_{3}, 162 \mathrm{~Hz}\right):-2.44 ;{ }^{13} \mathbf{C N M R}\left(\mathrm{CDCl}_{3}, 100 \mathrm{~Hz}\right): ~}$ 139.4 ( Ar ), 128.1 ( Ar ), 127.8 ( Ar ), 127.3 ( Ar ), $99.8\left(\mathrm{CCH}_{3}\right), 99.5\left(\mathrm{CCH}_{3}\right), 78.3(\mathrm{C}-5), 76.0(\mathrm{C}-2), 74.2\left(\mathrm{CH}_{2} \mathrm{Ar}\right)$, 68.9 ( $\mathrm{C}-1$ and $\mathrm{C}-3$ ), 68.1 (C-4 or C-6), 68.0 (C-4 or C-6), $61.6\left(\mathrm{MSE} \mathrm{CH}_{2}\right), 61.5\left(\mathrm{MSE} \mathrm{CH}_{2}\right), 55.2\left(\mathrm{MSE} \mathrm{CH}_{2}\right), 55.1$ $(\mathrm{MSE} \mathrm{CH} 2), 48.2\left(\mathrm{OCH}_{3} \mathrm{x} 2\right), 42.8\left(\mathrm{SCH}_{3}\right), 17.79\left(\mathrm{CCH}_{3}\right), 17.75\left(\mathrm{CCH}_{3}\right)$; HRMS (ESI): m/z calcd [M+Na]+ for $\mathrm{C}_{31} \mathrm{H}_{51} \mathrm{O}_{17} \mathrm{PS}_{2}: 813.2197$, found: 813.2188.

## 2-O-Benzyl-myo-inositol-5-bis[2-(methanesulfonyl)ethyl]phosphate (6)

2-O-Benzyl-1,6:3,4-bis-O-(2,3-dimethoxybutane-2,3-diyl)-myo-inositol-5-bis[2-(methanesulfonyl)ethyl] phosphate ( $5,396 \mathrm{mg}, 0.50 \mathrm{mmol}$ ) was dissolved in a mixture of TFA ( 4.5 mL ) and water ( 0.5 mL ). The reaction mixture was allowed to stir for 10 min under argon, during which time the solution turned dark yellow. The solution was then concentrated in vacuo without heating. The resultant residue was dissolved in methanol and concentrated in vacuo to yield the crude product as a white solid. The product was purified by recrystallization from boiling ethanol to yield the pure product as colourless crystals ( $249 \mathrm{mg}, 0.44 \mathrm{mmol}$, 88\% yield). 1HNMR (d4-MeOH, 400 Hz ): 7.43-7.41 (m, 2H, Ar), 7.33-7.23 (m, 3H, Ar), 4.61-4.56 (m, 6H, CH2 Ar and MSE CH2 $), 4.10(\mathrm{q}, J=9.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-5), 3.92(\mathrm{t}, J=2.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2), 3.82(\mathrm{t}, J=9.6 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}-4$ and H-6), 3.53 ( $\mathrm{t}, J=5.5 \mathrm{~Hz}, 4 \mathrm{H}, \mathrm{MSE} \mathrm{CH}_{2}$ ), $3.48\left(\mathrm{dd}, J=9.9,2.5 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}-1\right.$ and $\mathrm{H}-3$ ), $3.04\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SCH}_{3}\right.$ ); ${ }^{31}$ PNMR: (d6-DMSO, 162 Hz ) -2.26; ${ }^{13}$ CNMR (d6-DMSO, 100 Hz ): 139.8 (Ar), 128.0 (Ar), 127.1 ( Ar ), 83.5 (C-5), 81.8 (C-2), 74.4 $\left(\mathrm{CH}_{2} \mathrm{Ar}\right), 71.5$ (C-1 and C-3), 71.4 (C-4 and C-6), $61.11\left(\mathrm{MSE} \mathrm{CH}_{2}\right), 61.06\left(\mathrm{MSE} \mathrm{CH}_{2}\right), 54.2(\mathrm{MSE} \mathrm{CH} 2), 54.1(\mathrm{MSE}$ $\left.\mathrm{CH}_{2}\right), 42.0\left(\mathrm{SCH}_{3}\right)$; HRMS (ESI): $m / z$ calcd $[\mathrm{M}+\mathrm{H}]^{+}$for $\mathrm{C}_{19} \mathrm{H}_{31} \mathrm{O}_{13} \mathrm{PS}_{2}$ : 563.1016 , found: 563.1014.
myo-Inositol-5-bis[2-(methanesulfonyl)ethyl]phosphate (7)

2-O-Benzyl-myo-inositol-5-bis[2-(methanesulfonyl)ethyl]phosphate ( $6,100 \mathrm{mg}, 0.178 \mathrm{mmol}$ ) was dissolved in THF ( 2.5 mL ) and ultrapure water ( 0.5 mL ). To this solution, three drops of acetic acid and palladium hydroxide on carbon ( $20 \mathrm{mg}, 20 \%$ ) were added. The reaction mixture was allowed to stir under hydrogen for 24 hours at RT. The catalyst was then filtered off, and the solution was concentrated in vacuo. The residue was dissolved in ultrapure water and lyophilised to yield the product as a white solid ( $66.9 \mathrm{mg}, 0.142 \mathrm{mmol}, 80 \%$ yield). Due to compound instability when in solution, the compound was only partially characterised before being used in the next step. ${ }^{1} \mathrm{HNMR}(\mathrm{d} 6-\mathrm{DMSO}, 400 \mathrm{~Hz}): 4.98(\mathrm{~d}, J=5.7 \mathrm{~Hz}, 2 \mathrm{H}), 4.70(\mathrm{~d}, J=3.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.69(\mathrm{~d}$, $J=5.9 \mathrm{~Hz}, 2 \mathrm{H}), 4.44-4.34(\mathrm{~m}, 4 \mathrm{H}), 3.93(\mathrm{q}, J=9.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.71(\mathrm{q}, J=3.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.60-3.54(\mathrm{~m}, 2 \mathrm{H}), 3.51(\mathrm{t}, J=5.7$ $\mathrm{Hz}, 4 \mathrm{H}), 3.23-3.18(\mathrm{~m}, 2 \mathrm{H}), 3.01(\mathrm{~s}, 6 \mathrm{H})$; ${ }^{31} \mathbf{P N M R}(\mathrm{~d} 6-\mathrm{DMSO}, 162 \mathrm{~Hz}):-2.21$.
myo-Inositol-1,2,3,4,6-pentakis(dibenzyl)phosphate-5-bis[2-(methanesulfonyl)ethyl]-phosphate (8)

myo-Inositol-5-bis[2-(methanesulfonyl)ethyl]phosphate ( $7,110 \mathrm{mg}, 0.233 \mathrm{mmol}$ ) was dissolved in dry MeCN and the solution concentrated in vacuo three times, then the residue was suspended in dry DCM and the solution concentrated again thoroughly to dry the starting material. The starting pentaol (7) was then suspended in dry DCM ( 15 mL ) and put under argon. To this suspension, 5 -phenyl- $1 H$-tetrazole ( $510 \mathrm{mg}, 3.49$ mmol, 15.0 equiv.) and dibenzyl phosphoramidite ( $0.8 \mathrm{~mL}, 2.33 \mathrm{mmol}, 10.0$ equiv) were added, and the reaction mixture was allowed to stir at RT for 16 h . The solution was then cooled to $-78^{\circ} \mathrm{C}$ before $m \mathrm{CPBA}$ ( 858 $\mathrm{mg}, 70 \%, 3.49 \mathrm{mmol}, 15.0$ equiv) was added. The reaction mixture was allowed to warm to RT and was then diluted with EtOAc ( 150 mL ). The solution was washed with $10 \%$ aq. $\mathrm{Na}_{2} \mathrm{SO}_{3}(2 \times 30 \mathrm{~mL})$ and $1.0 \mathrm{M} \mathrm{HCl}(30$ $\mathrm{mL})$, dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo. The residue was purified by flash column chromatography (P.E.-EtOAc, $0-100 \%$ ) to give the pure product as a colourless oil ( $329.1 \mathrm{mg}, 0.225 \mathrm{mmol}, 97 \%$ yield). ${ }^{\mathbf{1}}$ HNMR ( $\mathrm{CDCl}_{3}, 400 \mathrm{~Hz}$ ): 7.32-7.23 (m, 46H, Ar), 7.17-7.15 (m, 4H, Ar), 5.67 (br d, J= 9.0 Hz, 1H, H-2), 5.23-5.19 (m, 2H, $\mathrm{CH}_{2} \mathrm{Ar}$ ), 5.14-4.90 (m, $18 \mathrm{H}, \mathrm{H}-4$ and $\mathrm{H}-6$ and $\mathrm{CH}_{2} \mathrm{Ar}$ ), 4.82-4.77 (m, 2H, CH2Ar), 4.54 (q, J= 9.5 Hz, 1H, H-5), 4.49-4.43 ( $\mathrm{m}, 2 \mathrm{H}, \mathrm{MSE} \mathrm{CH}_{2}$ ), 4.39-4.28 (m, 4H, H-1 and H-3 and MSE CH ${ }_{2}$ ), 3.19-3.06 (m, 4H, MSE CH $\mathrm{H}_{2}$ ), $2.76(\mathrm{~s}$,
 (m, Ar), 128.9-128.8 (m, Ar), 128.0 ( Ar ), 77.4 (C-5), 75.6 (C-2), 74.7 (C-4 and C-6), 73.3 ( $\mathrm{C}-1$ and $\mathrm{C}-3$ ), 70.4$70.0\left(\mathrm{~m}, \mathrm{CH}_{2} \mathrm{Ar}\right), 62.21\left(\mathrm{MSE} \mathrm{CH}_{2}\right), 62.17\left(\mathrm{MSE} \mathrm{CH}_{2}\right), 54.5\left(\mathrm{MSE} \mathrm{CH}_{2}\right), 54.4\left(\mathrm{MSE} \mathrm{CH}_{2}\right), 42.5\left(\mathrm{SCH}_{3}\right)$; HRMS (ESI): $\mathrm{m} / \mathrm{z}$ calcd $[\mathrm{M}+\mathrm{H}]+$ for $\mathrm{C}_{82} \mathrm{H}_{90} \mathrm{O}_{28} \mathrm{P}_{6} \mathrm{~S}_{2}$ : 1773.3558, found: 1773.3518.

## 5-Diphospho-myo-inositol-1,2,3,4,6-pentakisphosphate triethylammonium salt (1)

myo-Inositol-1,2,3,4,6-pentakis(dibenzyl)phosphate-5-bis[2-(methanesulfonyl)ethyl]-phosphate ( $\mathbf{8}, 65.2 \mathrm{mg}$, 0.045 mmol ) was dissolved in $\mathrm{CDCl}_{3}(2 \mathrm{~mL})$ in an NMR tube, and to this solution DBU ( $25 \mu \mathrm{~L}, 177 \mu \mathrm{~mol}, 4.0$ equiv.) followed by BSTFA ( $114 \mu \mathrm{~L}, 461 \mu \mathrm{~mol}, 10.3$ equiv.) were added. ${ }^{31} \mathrm{PNMR}$ was used to ensure the silylation was complete with singlets at -0.97 (2P), $-1.70(2 \mathrm{P}),-2.42(1 \mathrm{P})$ and a diagnostic singlet at -17.51 (1P). Methanol ( $26 \mu \mathrm{~L}, 2.05 \mathrm{mmol}$ ) was then added to the reaction and, after $3 \mathrm{~min}, \mathrm{TFA}(27 \mu \mathrm{~L}, 0.347 \mathrm{mmol}$ ) was added. ${ }^{31} \mathrm{PNMR}$ spectroscopy confirmed that desilylation was completed with signals at 2.64 (1P), -1.62 (2P) and -1.94 (3P). The reaction mixture was concentrated and the residue was thoroughly dried on a vacuum line. This crude residue was then dissolved in $\mathrm{CDCl}_{3}$, and to this solution 5 -phenyl- 1 H -tetrazole ( $42.9 \mathrm{mg}, 0.29$ mmol, 6.6 equiv.) and dibenzyl phosphoramidite ( $41 \mu \mathrm{~L}, 0.12 \mathrm{mmol}, 2.7$ equiv.) were added. After an hour, an additional portion of phosphitylating agent ( $41 \mu \mathrm{~L}, 0.12 \mathrm{mmol}, 2.7$ equiv.) was added, and the reaction mixture was allowed to stir for another 2h. ${ }^{31}$ PNMR spectroscopy confirmed successful phosphitylation with a signal at 139.6 ( $\beta$-P). The reaction mixture was then cooled to $-78{ }^{\circ} \mathrm{C}$, before $m$ CPBA ( $13 \mathrm{mg}, 70 \%, 0.052 \mathrm{mmol}, 2$ equiv) was added. The solution was allowed to warm to RT, before being concentrated in vacuo without heat. This residue (9) was purified by column chromatography (EtOAc and MeOH, 0-20\%), before being immediately deprotected via hydrogenation (the compound was not studied at this stage as the product proved to be unstable following purification).
The protected pyrophosphate (assumed $9,40.8 \mathrm{mg}, 0.0224 \mathrm{mmol}$ ) was dissolved in a mixture of THF ( 4.6 mL ), $\mathrm{MeOH}(3 \mathrm{~mL})$ and 1M TEAB ( 2.1 mL ). To this solution, $\mathrm{Pd}(\mathrm{OH})_{2} / \mathrm{C}(20 \%, \geq 50 \%$ wet, 27.2 mg$)$ was added. The flask was evacuated and flushed with hydrogen three times before leaving the solution to stir in an atmosphere of hydrogen. It was allowed to stir at RT under hydrogen for 3 days. The crude product was purified on an RP18 column, and the product was identified in the column fractions using a Briggs qualitative phosphate assay. The product fractions were concentrated in vacuo without heat, lyophilised and product collected as an offwhite glass ( 21.7 mg , calculated 6.5 TEA counterions per molecule of product, $0.0155 \mathrm{mmol}, 69 \%$ yield estimated for the hydrogenation step, $35 \%$ yield for the complete pyrophosphorylation sequence). ${ }^{\mathbf{1}} \mathbf{H N M R}$ (d4-MeOH, 400 Hz ): $4.97(\mathrm{dt}, J=2.9,10.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2), 4.60(\mathrm{q}, J=9.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}-4$ and $\mathrm{H}-6), 4.35-4.25(\mathrm{~m}, 3 \mathrm{H}, \mathrm{H}-$ 1, H-3 and H-5), 3.15 ( s , approx. 39H, TEA CH 2 ), 1.30 ( s , approx. $59 \mathrm{H}, \mathrm{TEA} \mathrm{CH} 3$ ); ${ }^{31}$ PNMR (d4-MeOH, 162 Hz ): 0.87 (2P), 0.68 (2P), $-0.29,-10.70(\mathrm{~d}, J=22.8 \mathrm{~Hz}$, pyrophosphate $\beta-\mathrm{P}$ ), -11.81 ( $\mathrm{d}, J=22.8 \mathrm{~Hz}$, pyrophosphate $\alpha-$ P); ${ }^{13}$ CNMR ( $\mathrm{d} 4-\mathrm{MeOH}, 100 \mathrm{~Hz}$ ): 79.4 (C-5), 77.5 (C-4 and C-6), 76.8 (C-2), 75.5 (C-1 and C-3), 47.2 (TEA CH ${ }_{2}$ ), 9.3 (TEA CH ${ }_{3}$ ); HRMS (ESI): $\mathrm{m} / \mathrm{z}$ calcd [M-H]- for $\mathrm{C}_{6} \mathrm{H}_{19} \mathrm{O}_{27} \mathrm{P}_{7}: 738.8204$, found: 738.8206.

## Photophysical measurements of [Eu.3]+

Figure S1. Large separation between the absorption and emission spectrum of [Eu.3]+ (5 $\mu \mathrm{M}$ ), measured in 10 mM HEPES at pH 7.0 and 295 K .

Figure S2. Emission spectral form of [Eu.3]+(5 $\mu \mathrm{M}$ ) (a) alone, (b) with added 5-PP-InsP ${ }_{5}(250 \mu \mathrm{M})$, (c) with added Insp6 $(250 \mu \mathrm{M})$. Measured in 10 mM HEPES at pH 7.0 and $295 \mathrm{~K}, \lambda_{\mathrm{exc}}=330 \mathrm{~nm}$.

Figure S3. Large enhancement in emission intensity of [Eu.3] ${ }^{+}(5 \mu \mathrm{M})$ with added 5-PP-InsP ${ }_{5}(250 \mu \mathrm{M})$ compared with the minor emission changes with added inositol phosphates including $\operatorname{Ins} \mathrm{P}_{6}, \operatorname{Ins}(3) \mathrm{P}_{1}$, Ins $(1,4,5) \mathrm{P}_{3}, \operatorname{Ins}(1,3,4,5) \mathrm{P}_{4}, \operatorname{Ins}(1,3,5,56) \mathrm{P}_{4}, \operatorname{Ins}(3,4,5,6) \mathrm{P}_{4}$, and glucose-6-phosphate ( $250 \mu \mathrm{M}$ each). Measured in 10 mM HEPES at pH 7.0 and $295 \mathrm{~K}, \lambda_{\mathrm{exc}}=330 \mathrm{~nm}$.

Figure S4. Binding titration of [Eu.3] ${ }^{+}$with $5-\mathrm{PP}-\mathrm{InsP}_{5}$. (a) Change in emission spectrum upon incremental addition of PP-InsP ${ }_{5}$. (b) Plot of fraction bound (determined from $\Delta J=2 / \Delta J=1$ intensity ratio) versus concentration of $5-\mathrm{PP}^{2}-\mathrm{InsP}_{5}$, showing the fit to a $1: 1$ binding isotherm. Data shown are a representative example of two independent experiments. Conditions: $5 \mu \mathrm{M}$ [Eu.3] ${ }^{\text {in }} 10 \mathrm{mM}$ HEPES, pH $7.0,295 \mathrm{~K}, \lambda_{\text {ex }}=330$ nm.

## Data obtained from fitting of the titration of [Eu.3]+ with 5-PP-InsP ${ }_{5}$ to a $1: 1$ and $2: 1$ binding model

 using Bindfit, can be accessed here:

Figure S5. Comparison of emission spectral changes of [Eu.3]+ (5 $\mu \mathrm{M}$ ) with added 5-PP-InsP ${ }_{5}$ (red line), $\mathrm{InsP}_{6}$ (light blue), ADP (green) and pyrophosphate (purple) ( $250 \mu \mathrm{M}$ each). (a) Overall Eu emission, (b) Expansion of the $\Delta J=2$ band ( $600-630 \mathrm{~nm}$ ) and (c) $\Delta J=4$ band ( $675-715 \mathrm{~nm}$ ). Measured in 10 mM HEPES at pH 7.0 and $295 \mathrm{~K}, \lambda_{\text {exc }}=330 \mathrm{~nm}$.

Figure S6. Comparison of emission spectral changes of [Eu.3]+ ( $5 \mu \mathrm{M}$ ) with added $5-\mathrm{PP}^{-I n s P} \mathrm{P}_{5}$ (red line), 1-PPInsP $_{5}$ (green) and $\mathrm{InsP}_{6}$ (light blue) ( $250 \mu \mathrm{M}$ each). Measured in 10 mM HEPES at pH 7.0 and $295 \mathrm{~K}, \lambda_{\text {exc }}=330$ nm .

Figure S7. Minimal variation in emission spectra of [Eu.3]+ $(5 \mu \mathrm{M})$ in the presence of 5-PP-InsP ${ }_{5}(250 \mu \mathrm{M})$ over a 60 minute incubation period. Measured in 10 mM HEPES at pH 7.0 and $295 \mathrm{~K}, \lambda_{\text {exc }}=330 \mathrm{~nm}$.

Figure S8. Enzyme simulation reaction demonstrating a linear increase in time-resolved emission of [Eu.3] ${ }^{+}$ with increasing 5-PP- $\mathrm{InsP}_{5} / \mathrm{InsP}_{6}$ molar ratio in the presence of bovine serum albumin (BSA). Data are mean $\pm$ SEM ( $\mathrm{r}^{2}>0.99$ ) from experiments performed using $5 \mu \mathrm{M}\left[\right.$ Eu. 3 ] ${ }^{+}, 0.2 \mathrm{mg} / \mathrm{mL}$ BSA, $100 \mu \mathrm{M}$ total 5 -PP-InsP ${ }_{5}$ + InsP $_{6}$, in 10 mM HEPES, pH 7.0.

## DFT-optimised molecular structures and ab initio luminescence spectra

Figure S9. 3D-Molecular structure and simulated luminescence spectrum of the water-bound complex.

Figure S10. 3D-Molecular structure and simulated luminescence spectrum of an alternative conformer of the water-bound complex with the quinoline arm exchanged for a carboxylic acid group. This structure was found to be higher in free energy than the above one by $17.0 \mathrm{~kJ} / \mathrm{mol}$.

Figure S11. Alternative depictions of the 5-PP-InsP5 ${ }_{5}$ bound structure, highlighting the hydrogen bonds formed (as yellow dashed lines) and the dissociation of one of the quinoline arms (panel (a), background). The phosphate groups involved in hydrogen bonding (2P, 3P) and the pyrophosphate group (5PP) are labelled for clarity.

Figure S12. Monodentate binding mode of 5-PP-InsP5. This structure was found to be $9.2 \mathrm{~kJ} / \mathrm{mol}$ higher in energy than the bidentate binding mode.

Figure S13. Most stable binding mode of $\mathrm{InsP}_{6}$ (featuring binding in axial position). This structure showed reduced binding by $22.3 \mathrm{~kJ} / \mathrm{mol}$ compared to the bidentate binding mode of 5-PP-InsP5.
