1. Materials and instrumentation details

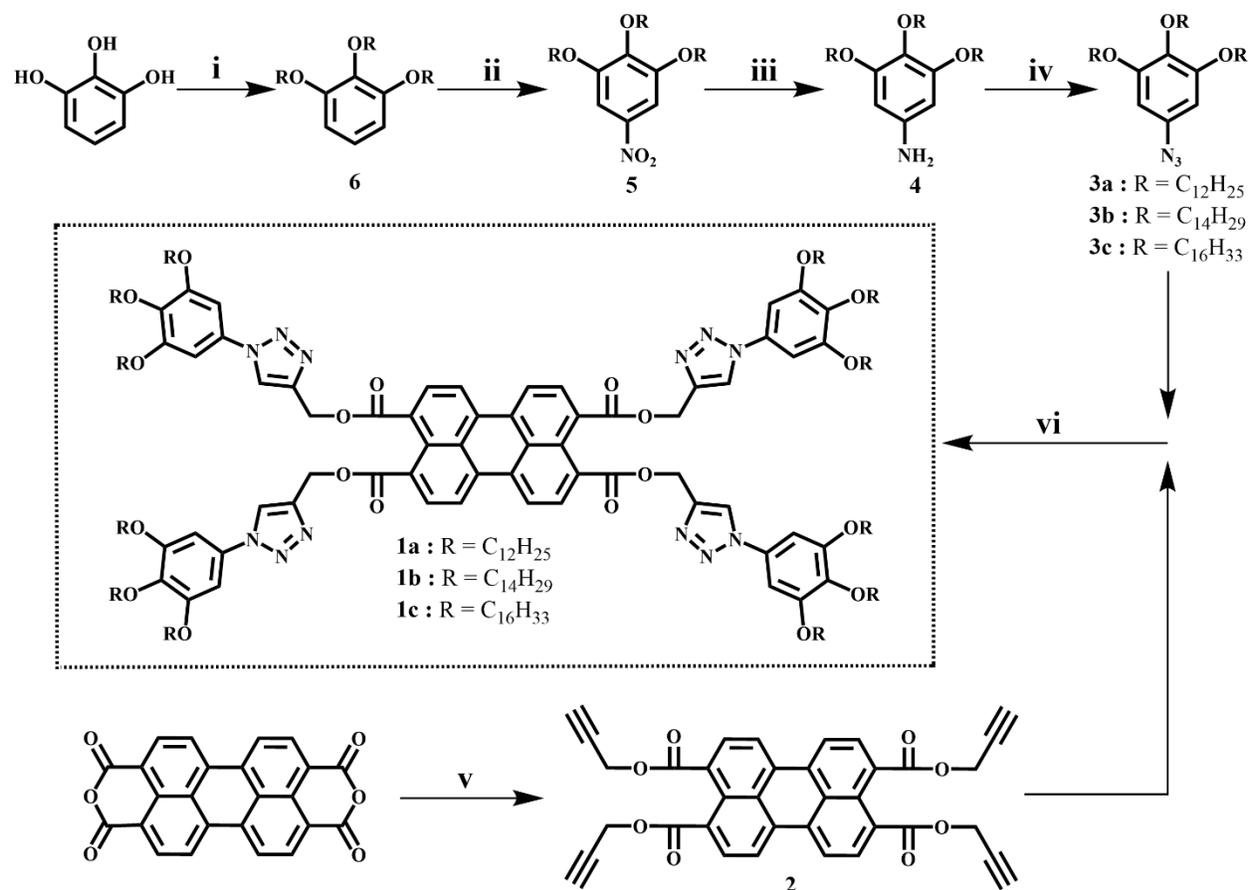

1.1. Materials. All commercially available solvents and chemicals (AR quality) were used as such to carry out the reactions without further purification or modification. Silica gel (100–200 mesh) and neutral alumina were used for the column chromatography to purify the final compounds and intermediates. For thin-layer chromatography (TLC), aluminum sheets pre-coated with silica gel (Merck, Kieselgel 60, F254) were used.

1.2. Instrumentation

The instrumental details are similar, as reported in our earlier work.¹⁻⁴

2. Experimental Section

The reaction scheme to synthesize the final compounds **1a-c** is below:

Scheme S1. Reagents and Conditions: (i) K₂CO₃, alkyl bromide, dimethylformamide, reflux, 72 h, yield - **6a**: 74%, **6b**: 75%, **6c**: 78%; (ii) NaNO₂, conc. HNO₃, DCM, RT, 12 h, yield - **5a**: 68%,

5b: 65%, **5c**: 67%; (iii) Pd/C, H₂ filled balloon, dry THF, 12 h, yield - **4a**: 90%, **4b**: 89%, **4c**: 92%; (iv) TMS-azide, *tert*-butyl nitrite, ACN, RT, 12 h, yield - **3a**: 72%, **3b**: 74%, **3c**: 75 %; (v) i. KOH, H₂O, 100 °C, 1 h; ii. propargyl bromide, tetraoctylammonium bromide (TOABr), 100 °C, 24 h, yield - 40%; (vi) Sodium ascorbate, CuSO₄·5H₂O, H₂O/EtOH/CHCl₃ (1:1:2), 65 °C, 48 h, yield - **1a**: 53%, **1b**: 56%, **1c**: 57%.

Synthesis. For the preparation of compounds **2**, **4**, **5**, and **6**, the same synthetic pathway was used as previously.^{1,5}

This present work reports the synthesis of final compounds **1a-c** and intermediates **3a-c**.

2.1. General procedure for the synthesis of 5-azido-1,2,3-tris(alkoxy)benzene (**3a-c**)

The synthetic pathway followed is the same as reported elsewhere, with slight modification.⁶ Compound **4** (500 mg, 1 equiv.) was dissolved in a dried 1:1 (v/v) mixture of acetonitrile (2 mL) and tetrahydrofuran (THF) (2.2 mL). After cooling the solution to 0 °C, *tert*-butyl nitrite (1.1 equiv.) was dropwise added to the reaction mixture, followed by the gradual addition of trimethylsilyl azide (1.8 equiv.). The reaction was kept for stirring at room temperature (RT) for 12 h. The extraction of crude product was done using dichloromethane (DCM) and water mixture. For purification, column chromatography (Silica Gel 100-200 mesh) with ethyl acetate/hexane (10:90) as eluent was used to give **3** as a brown solid. Yield - **3a**: 72%, **3b**: 74%, **3c**: 75%.

2.2. Procedure for synthesis of tetrakis((1-(3,4,5-tris(dodecyloxy)phenyl)-1H-1,2,3-triazol-4-yl)methyl) perylene-3,4,9,10-tetracarboxylate (**1a**)

The synthetic pathway followed is the same as reported elsewhere, with slight modification.⁷

Tetra(prop-2-yn-1-yl) perylene-3,4,9,10-tetracarboxylate (**2**) (50 mg, 1 equiv.), 5-azido-1,2,3-tris(dodecyloxy)benzene (**3a**) (463.08 mg, 8 equiv.), CuSO₄·5H₂O (21.50 mg, 1 equiv.) and sodium ascorbate (10.24 mg, 0.6 equiv.) were dissolved in the solvent mixture of CHCl₃ (4 ml)/EtOH (2 ml)/H₂O (2 ml). The reaction mixture was stirred vigorously and refluxed at 65 °C for 48 h. The crude product was extracted using chloroform (CHCl₃), followed by the purification using column chromatography (neutral alumina, ethyl acetate/hexane 15:85) to give a yellow solid after recrystallization using MeOH/DCM. Yield - 53%.

b. Quantum yield measurements

The procedure used for quantum yield measurement is similar to the previous report⁵ and is reproduced here for the reader's convenience.

Relative quantum yield was calculated using fluorescein ($\Phi_R = 0.79$ in 0.1M NaOH) as the reference fluorophore.

The following equation was used for the calculation of quantum yield values:

$$\Phi_F = \Phi_R \times \left(\frac{m_F}{m_R}\right) \times \left(\frac{\eta_F}{\eta_R}\right)^2$$

Where, Φ : fluorescence quantum yield, m : gradient of the plot of integrated fluorescence intensity against absorbance, η : refractive index of the solvent used (1.407 for THF and 1.33 for distilled water). Subscript R refers to the reference fluorophore, i.e., fluorescein in 0.1M aq. NaOH solution and subscript F refer to the fluorophore under investigation.

To minimize the re-absorption effects, the absorbance values were kept below 0.15.

After substituting all the values, the simplified equation was:

$$\Phi_F = 0.79 \times \left(\frac{m_F}{m_R}\right) \times \left(\frac{1.407}{1.33}\right)^2$$

$$\Phi_F = 0.88 \times \left(\frac{m_F}{m_R}\right)$$
