Table S3. The comparison of HER activity of the CoN_{0.73}Co₃/NF with that of other reported catalysts at the current density of 10 mA cm⁻².

Text S1. Experimental section

Preparation of CuNCo₃/NF and CoN_{0.73}Co₃/NF: In processing, 1 mmol Cu(NO₃)₂·3H₂O (99.0%, Sinopharm Chemical Reagent Co., Ltd), 3 mmol Co(NO₃)₂·6H₂O (98.5% Sinopharm Chemical Reagent Co., Ltd) and 14 mmol Co(NH₂)₂ (99.0% Sinopharm Chemical Reagent Co., Ltd) were dissolved into 60 mL deionized water and stirred. Then, the prepared aqueous solution and a NF substrate (XRD pattern and SEM images of bare NF were displayed in Fig. S1) were transferred into a 100 mL stainless-steel autoclave and reacted at 120°C for 10h. After the reaction, the sample was washed with deionized water and alcohol, and dried in an oven at 60°C. The obtained hydrothermal precursor was Cu-Co bimetallic hydroxide/NF. Then, the hydrothermal precursor of Cu-Co bimetallic hydroxide/NF was annealed at 420 °C under the flowing NH₃ atmosphere for 2h (as depicted in Scheme 1). The obtained product was CuNCo₃/NF. The catalyst loading mass of CuNCo₃/NF is ~4 mg cm⁻². Similar processing was carried out to prepare the CoN_{0.73}Co₃/NF, in which 4 mmol Co(NO₃)₂·6H₂O was used to prepare the aqueous solution without addition of Cu(NO₃)₂·3H₂O. The obtained product was CuNCo₃/NF. The catalyst loading mass of

CuNC₃/NF is ~4 mg cm⁻².

Preparation of Pt/C electrode and RuO₂ electrode: The 20 wt% Pt/C and RuO₂ were used as the reference samples for HER and OER, respectively. 10 mg catalyst was dispersed into the solution with 950 μL isopropanol and 50 μL 5 wt% Nafion, and ultrasonically stirred for more than 40 minutes until the dispersed ink was obtained. Then, 400 μL of the dispersed ink was loaded onto NF with the size of 1×1 cm² (loading mass of 4 mg cm⁻²). Finally, the as-prepared electrode was dried at room temperature for electrochemical measurements.

Text S2. Material characterizations

X-ray diffraction (XRD, Philips X'pert PRO). Scanning electron microscope (SEM, Quanta 200FEG). Transmission electron microscope (TEM, JEM-2100). The X-ray photoelectron spectroscopy (XPS, Thermo Scientific K-Alpha device with excitation source of Al K_α).

Text S3. Electrochemical measurements and evaluations

The conventional three-electrode system equipped with N₂ gas flow system was utilized for electrochemical measurements at room temperature in 1 M KOH electrolyte on a CHI660E workstation. Hg/HgO and graphite rod were used as the reference electrode and counter electrode, respectively. The prepared samples were used as the working electrodes. All the potentials were calibrated to reversible hydrogen electrode (RHE) according to the equation $E (vs. RHE) = E (vs. Hg/HgO) + E^{\circ}_{Hg/HgO} + 0.0591 \text{ pH}$ ($E^{\circ}_{Hg/HgO}$: 0.098V, pH: 14). LSV was measured at a scan rate of 2 mV s⁻¹. A series of

CV measurements were performed at different scan rates within 20 - 100 mV s^{-1} in the range of 1.025 - 1.125 V (vs. RHE) in order to calculate the ECSA. The ECSA was calculated as $\text{ECSA} = C_{\text{dl}}/C_s$. C_{dl} is double-layer capacitance and C_s represents $40 \mu\text{F cm}^{-2}$ in 1 M KOH. The C_{dl} was obtained by fitting the half slope of current density and scanning rate at the average potential range of CV. EIS was obtained at overpotential of 300 mV and -200 mV (vs. RHE) for OER and HER respectively in the frequency range of 0.1 - 10^5 Hz with 5 mV amplitude. The stability of the catalyst was tested by chronoamperometry. All data were calibrated by 90 % iR compensation.

Fig. S1 (a) XRD pattern and (b) SEM image of bare nickel foam (NF).

Fig. S2 XRD patterns of CoN_{0.73}Co₃.

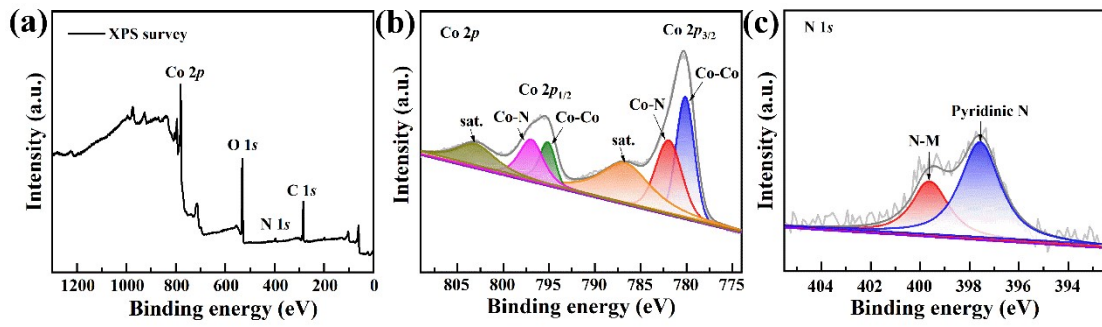

Fig. S3 XPS spectra of CoN_{0.73}Co₃, (a) survey scan, (b) Co 2p, (c) N 1s.

Fig. S4 (a, b) SEM images of Cu-Co bimetallic hydroxide/NF (precursor of CuNCo_3/NF). (c) XRD patterns of Cu-Co bimetallic hydroxide/NF. (d, e) SEM images of Co hydroxide/NF (precursor of $\text{CoN}_{0.73}\text{Co}_3/\text{NF}$). (f) XRD patterns of Co hydroxide/NF.

In Fig. S4c, XRD patterns of as-prepared Cu-Co bimetallic hydroxide/NF (precursor of CuNCo_3/NF) presents the coexistence of $\text{Cu}(\text{OH})_2$ (JPCDS No.035-0505), $\text{Co}(\text{OH})_2$ (JPCDS No. 002-0214) and NF (JPCDS No. 210-0644) phases. The peaks at 24.02° , 33.83° and 35.52° can be indexed to the (021), (002) and (111) plane of $\text{Cu}(\text{OH})_2$, and additional peaks at 17.56° , 34.62° and 36.27° can be assigned to the $\text{Co}(\text{OH})_2$.

In Fig. S4f, XRD patterns of as-prepared Co hydroxide/NF (precursor of $\text{CoN}_{0.73}\text{Co}_3/\text{NF}$) shows the coexistence of $\text{Co}(\text{OH})_2$ (JPCDS No. 002-0214) and NF (JPCDS No. 210-0644) phases. The peaks at about 17.73° , 34.21° and 35.95° can be indexed to the $\text{Co}(\text{OH})_2$.

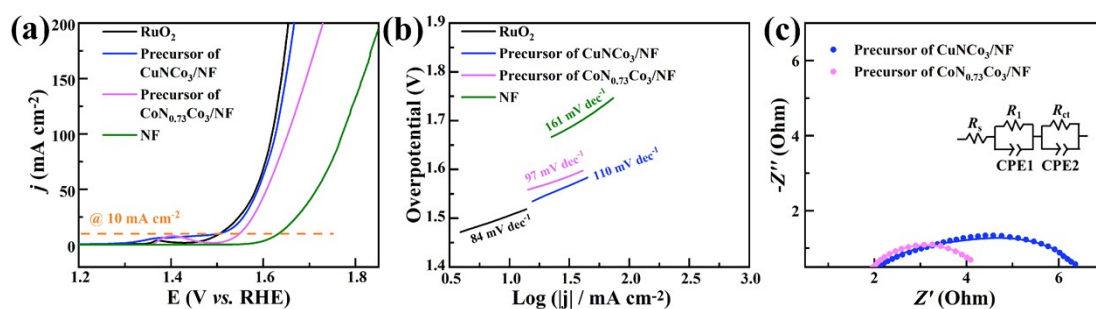

Fig. S5 Electrocatalytical OER testing in 1.0 M KOH. (a) LSV curves for precursors of CuNCo_3/NF , $\text{CoN}_{0.73}\text{Co}_3/\text{NF}$, RuO_2 and NF. (b) Tafel plots. (c) Nyquist plots and equivalent circuit.

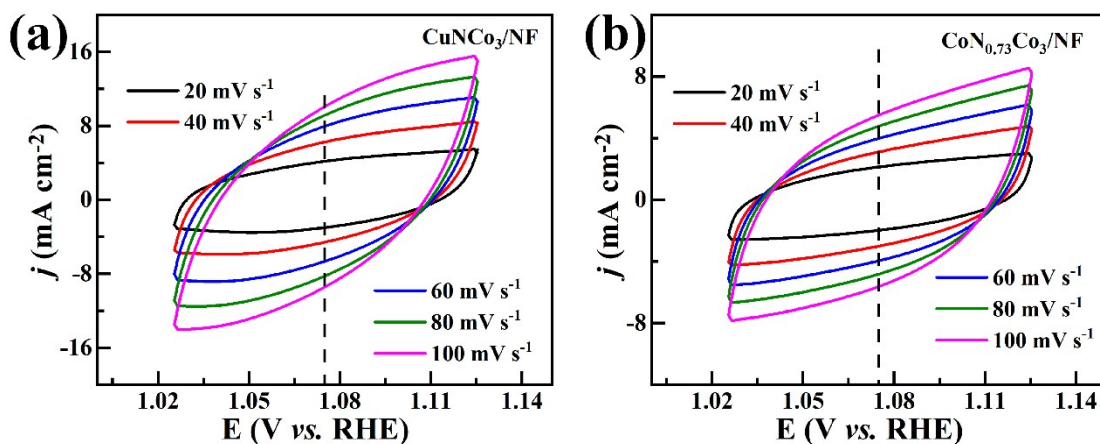

Fig. S6 CV curves of OER testing for (a) CuNCo₃/NF and (b) CoN_{0.73}Co₃/NF with 20, 40, 60, 80 and 100 mV s⁻¹ in non-Faradaic potential range.

Fig. S7 CV curves of OER testing for precursors of (a) CuNCo₃/NF and (b) CoN_{0.73}Co₃/NF with 20, 40, 60, 80 and 100 mV s⁻¹ in non-Faradaic potential range.

Fig. S8 Electrocatalytic HER testing results in 1 M KOH. (a) LSV curves for precursors of CuNCo₃/NF and CoN_{0.73}Co₃/NF, RuO₂ and NF. (b) Tafel plots. (c)

Nyquist plots and equivalent circuit.

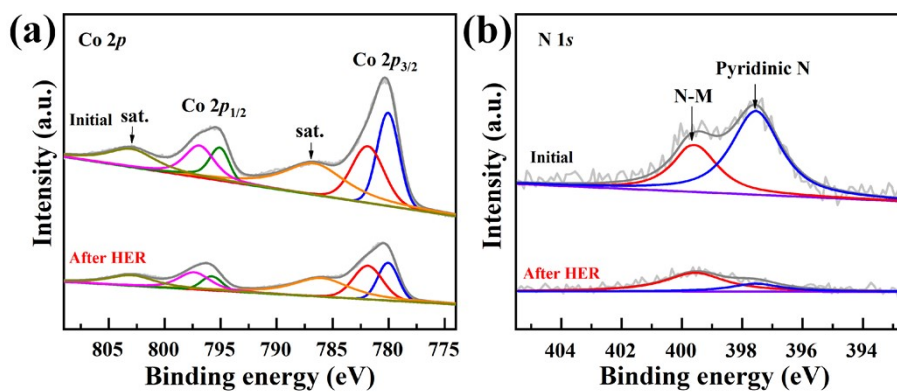

Fig. S17 The high-resolution XPS results for Co 2p and N 1s of CoN_{0.73}Co₃/NF electrode with initial and after stability test (48 h).

Fig. S18 The TEM mapping of CuNCo₃ after stability test (48 h).

Fig. S19 The TEM mapping of CoN_{0.73}Co₃ after stability test (48 h).

The calculation of electrochemical surface area:

The electrochemical surface area (ECSA) of each catalyst can be calculated according

$$A_{ECSA} = C_{dl} / (C_s \text{ per ESCA } cm^2)$$

C_s is the specific capacitance of atomically smooth planar surface in respective electrolytic medium.¹ In this work, C_s was 40 $\mu F cm^{-2}$ for 1.0 M KOH.²
