Long-term stability

Figure S2 illustrates the fitting to a linear regression of the long-term stability data. The intercept for each regression corresponds to the fresh membrane's CO_2 permeance. The figure shows R^2 regression values and the corresponding line equations. The time at which the CO_2 permeance was lowered by two was determined as the half-life of each configuration and values are presented in Table S4.

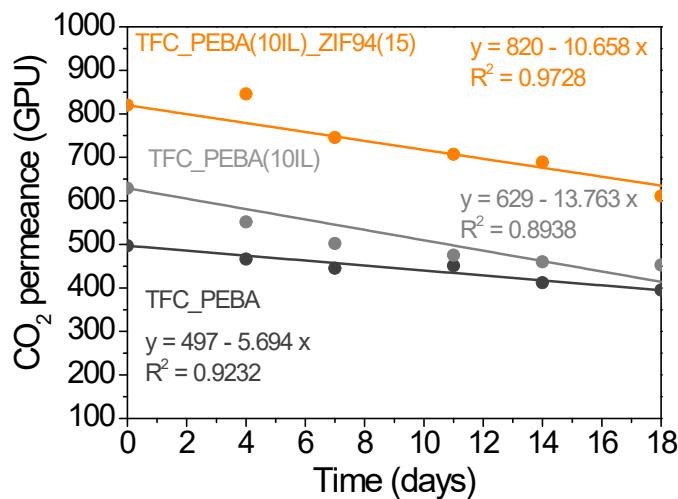

Figure S2. Linear fitting of the long-term stability studies of the TFC_PEBA, TFC_PEBA(10IL) and TFC_PEBA(10IL)_ZIF94(15) membranes with equations and R2 regression.

Table S4. Half-time in days calculated with the linear equations depicted in Figure S2.

Membrane	$\text{PCO}_{2,1/2}$ (GPU)	$t_{1/2}$ (days)
TFC_PEBA	249	44
TFC_PEBA(10IL)	315	23
