## Experimental Section

Materials and instrument: All the chemicals and reagents were purchased from Sigma-Aldrich, Alfa Aesar chemical company, and Tokyo Chemical Industry Co., Ltd. without any further purification. All solvents were ACS grade unless otherwise noted. BT (2,1,3-Benzothiadiazole) was purchased from Combi-Blocks. FBT and 2FBT were synthesized according to previously reported literature. ${ }^{[23]}$ PM6, L-PM6, H-PM6, and H-PTQ10 were synthesized according to the previously reported methods. ${ }^{[24]}$ PTQ10 was purchased from Brilliant Matters ( $\mathrm{M}_{\mathrm{n}}$ : 19.1 kDa , $\mathrm{M}_{\mathrm{w}}$ : 40.9 kDa, PDI: 2.14). Y6 and BTP-eC9 were purchased from eflexPV. The molecular weights of the PM6 and PTQ10 were characterized with high-temperature gel permeation chromatography (HR-GPC) at $100{ }^{\circ} \mathrm{C}$ using polystyrene as the standard in 1,2,4trichlorobenzene (HPLC grade). The FT-IR absorption spectra were measured on a Varian 670 infrared spectrometer with wavenumber ranging from 1000 to $4000 \mathrm{~cm}^{-1}$. The solutions for FT-IR absorption spectra were prepared by PM6 films with BT solid additives of optimized weight ratio in chloroform with same concentration of $8 \mathrm{mg} \mathrm{mL}^{-1}$.

Synthesis of PM6: Diorganobromide ( $500 \mathrm{mg}, 0.532 \mathrm{mmol}$ ) and diorganostanne ( 407.6 mg , 0.532 mmol ) compounds were dissolved in toluene ( 22.5 ml ) in a two-neck round flask and then purged with argon for 30 min . A solution of $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(24.6 \mathrm{mg}, 0.021 \mathrm{mmol})$ in anhydrous toluene ( 2.5 ml ) was added to the mixture in one portion in an argon state. Then the mixture was heated at $120^{\circ} \mathrm{C}$ in a pre-heated oil bath for 12 h . The resulting polymers were precipitated in methanol, followed by Soxhlet extraction in sequence of methanol, acetone, and n-hexane. Finally, the chloroform fraction was extracted and reprecipitated in methanol to get the target product ( $\mathrm{M}_{\mathrm{n}}: 41.3 \mathrm{kDa}, \mathrm{M}_{\mathrm{w}}: 109.7 \mathrm{kDa}$, PDI: 2.66).

Synthesis of L-PM6: According to the procedure described above, the mixture was heated at $120^{\circ} \mathrm{C}$ in a pre-heated oil bath for 9 h to synthesize L-PM6 $\left(\mathrm{M}_{\mathrm{n}}: 30.4 \mathrm{kDa}, \mathrm{M}_{\mathrm{w}}: 106.9 \mathrm{kDa}, \mathrm{PDI}\right.$ : 3.51).

Synthesis of H-PM6: According to the procedure described above, the mixture was heated at $120^{\circ} \mathrm{C}$ in a pre-heated oil bath for 36 h to synthesize $\mathrm{H}-\mathrm{PM} 6\left(\mathrm{M}_{\mathrm{n}}: 49.3 \mathrm{kDa}, \mathrm{M}_{\mathrm{w}}: 144.7 \mathrm{kDa}\right.$, PDI: 2.93).

Synthesis of H-PTQ10: 2,5-bis(trimethylstannyl)thiophene ( $82.0 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and 5,8-dibromo-6,7-difluoro-2-((2-hexyldecyl)oxy)quinoxaline (112.9 $\mathrm{mg}, 0.2 \mathrm{mmol}$ ) were dissolved in anhydrous toluene ( 6 mL ) in a long Schlenk flask, and purged with argon for 20 min . Then,
of tetrakis(triphenylphosphine)palladium( 0 ) ( $6.9 \mathrm{mg}, 0.006 \mathrm{mmol}$ ) was added and purged again with argon for 20 min . The reaction mixture was stirred at $110^{\circ} \mathrm{C}$ for 36 h . After cooling down, the crude mixture was poured into methanol, then transferred to thimble filter. Sequential Soxhlet extraction with methanol, acetone, and hexane was performed to remove low molecular weight fractions. The residue was extracted with chloroform, concentrated, and precipitated to methanol. The purified polymer was collected by filtration and dried in high vacuum oven ( $\mathrm{M}_{\mathrm{n}}$ : $46.7 \mathrm{kDa}, \mathrm{M}_{\mathrm{w}}$ : 111.8 kDa, PDI: 2.39).

Device fabrication and characterization: The patterned ITO-coated glass substrates were rinsed using detergent, acetone and isopropanol and were subsequently dried overnight in an oven. The substrate size of $1.5 \mathrm{~cm} \times 1.5 \mathrm{~cm}$ was employed for the devices with area of 0.048 and $0.92 \mathrm{~cm}^{2}$, while the substrate $(2.5 \mathrm{~cm} \times 2.5 \mathrm{~cm})$ was used in the device with 2.50 $\mathrm{cm}^{2}$. All the LBL PSCs were fabricated using the same conditions and procedures. PM6/Y6 based LBL device was fabricated with a configuration of ITO/PEDOT:PSS/PM6/Y6/PDINO/AI. PEDOT:PSS (Bayer Baytron 4083) was spin-coated at 4000 rpm onto an ITO substrate, followed by annealing at $140^{\circ} \mathrm{C}$ for 10 min in air. As for the LBL PSCs, PM6 solution was prepared in chloroform at $8 \mathrm{mg} \mathrm{mL}^{-1}$ with 10 to $40 \%(\mathrm{w} / \mathrm{w})$ BT solid additives of the PM6 concentration. Y 6 solution was prepared in chloroform at $9 \mathrm{mg} \mathrm{mL}^{-1}$ with $0.5 \% \mathrm{CN}$ of the solvent volume. The PM6 solution was spin-coated on the PEDOT:PSS film at 2200 rpm for 60 s , and then annealed at $100^{\circ} \mathrm{C}$ for 5 min . Y6 is deposited on the PM6 film at 2300 rpm for 60 s with annealing at $100^{\circ} \mathrm{C}$ for 5 min . In case of PTQ10/Y6 based device, PTQ10 and Y 6 were prepared at $7 \mathrm{mg} \mathrm{mL}^{-1}$ and $9 \mathrm{mg} \mathrm{mL}^{-1}$ respectively. For PM6/BTP-eC9 based device, the device structure of ITO/PEDOT:PSS/PM6/BTP-eC9/PFN-Br/Ag. PM6 was prepared at 7 mg mL -and BTP-eC9 with concentration of $9 \mathrm{mg} \mathrm{mL}^{-1}$. The donor polymer film with FBT additive was treated with thermal annealing at $100^{\circ} \mathrm{C}$ for 5 min , and then the acceptor film is processed with annealing at $100^{\circ} \mathrm{C}$ for 5 min . Then, a methanol solution of PDINO ( $1.0 \mathrm{mg} \mathrm{mL}^{-1}$ ) or PFN$\mathrm{Br}\left(0.5 \mathrm{mg} \mathrm{mL}^{-1}\right)$ was spin-coated onto the active layer with a spin rate of 3000 rpm for 30 s . Finally, a 100 nm Al or Ag cathode was thermally evaporated on top of the substrates under vacuum ( $<3.0 \times 10^{-6} \mathrm{~Pa}$ ).

The $J-V$ characteristics were measured on a Keithley 2400 source under the illumination of an AM 1.5 G solar simulator with an intensity of $100 \mathrm{~mW} \mathrm{~cm}^{-2}$. EQE measurements were conducted using Model QE-R3011 (Enli Technology) in ambient air. The hole and electron
mobilities were measured via using the SCLC method. Device structures are ITO/PEDOT:PSS/Donor/Acceptor/Au for hole-only devices and ITO/ZnO/Donor/Acceptor/AI for electron-only devices, respectively. The SCLC mobilities were calculated using the MottGurney equation, $J_{\text {SCLC }}=(9 / 8) \varepsilon_{0} \varepsilon_{r} \mu\left(\left(V^{2}\right) /\left(L^{3}\right)\right)$, where $\varepsilon_{r}$ is the relative dielectric constant of the organic semiconductor, $\varepsilon_{0}$ is the permittivity of empty space, $\mu$ is the mobility of zero-field, $L$ is the thickness of the active layer, and $V$ is applied voltage across the device. XPS was measured using K-alpha.

Morphology characterization: AFM images of thin films were obtained using multimode V microscope (Veeco, USA) with a nanscope controller using Si tips (Bruker). TEM analysis was performed using a JEOL USA JEM-2100F (Cs corrector) transmission electron microscope. GIWAXS was carried out at the PLS-II 6D U-SAXS and 9A beamline of the Pohang Accelerator Laboratory in Korea. The scattering signal was recorded using a 2-D CCD detector (Rayonix SX165). The X-ray light had an energy of 11.24 KeV . The incidence angle of X-rays was adjusted to 0.09-0.12 to maximize the signal to background ratio.
