## Instruments and Measurements

Device Fabrication. The conventional device structure of ITO/ PEDOT:PSS/ active layer/ PNDIT-F3N/ Ag was adopted in this study. The optimal D/A ratio was kept constant at 1:1.2 (wt/wt), in which the donor concentration is $7 \mathrm{mg} / \mathrm{ml}$. The blend solutions were stirred at $60^{\circ} \mathrm{C}$ for 2 h to fully dissolve. Prior to spin-coating the active layer solutions, $0.5 \% \mathrm{CN}(\mathrm{v} / \mathrm{v})$ was added to the CF. PNDIT-F3N was dissolved in methanol at a concentration of $0.5 \mathrm{mg} / \mathrm{mL}$. The mixed solutions were spin-coated onto the PEDOT:PSS layers, and the thicknesses of all active layers were about 100 nm . Then the films were treated with thermal annealing at $100{ }^{\circ} \mathrm{C}$ for 10 min . PNDIT-F3N
was spin-coated on the top of the active layers. Finally, 100 nm thick Ag was deposited on the top of PNDIT-F3N layer under high vacuum.

Optical Absorption. Absorption spectra of all the materials in the solid thin films were measured on Shimadzu UV3600 plus spectrometer. Thin films were prepared by spin coating from the chloroform solutions.

Photovoltaic Properties. The $J-V$ measurements were performed via the AAA solar simulator (SS-F5-3A, Enli Technology Co. Ltd, Taiwan) along with AM 1.5G spectra whose intensity was calibrated by the certified standard silicon solar cell at 100 $\mathrm{mW} / \mathrm{cm}^{2}$. The EQE spectra were measured through the Solar Cell Spectral Response Measurement System QE-R3011 (Enli Technology Co. Ltd, Taiwan). The thickness of the blend layers was measured via the surface profilometer Bruker Dektak XT.

Morphology Characterizations. The surface morphology of films was measured by a Nanoscope V AFM (Bruker Multimode 8) in tapping mode. The type of AFM cantilever is RTESPA-300, which possesses a $k$ constant of about $40 \mathrm{~N} / \mathrm{m}$. The scanning area was $2 \mu \mathrm{~m} \times 2 \mu \mathrm{~m}$ and the resolution is $256 \times 256$ pixels.

Figure S2. The energy level diagram of three neat materials.

Table S1. The peak position and $C L$ in IP directions of neat PM6 and PTQ10.
Sample $\quad$ Position $\left(\AA^{-1}\right) \quad$ Stacking Distance $\left.(\AA) \quad \operatorname{FWHM}\left(\AA^{-1}\right) \quad C L(\AA)^{\text {a }}\right)$

| PM6 | 0.34 | 18.57 | 0.199 | 28.4 |
| :---: | :---: | :---: | :---: | :---: |
| PTQ10 | 0.28 | 22.74 | 0.116 | 48.4 |

[^0]Table S2. The peak position and CL in OOP directions of neat PM6 and PTQ10.

$$
\text { Sample } \quad \operatorname{Position}\left(\AA^{-1}\right) \quad \text { Stacking Distance }(\AA) \quad \text { FWHM }\left(\AA^{-1}\right) \quad C L(\AA)
$$

| PM6 | 1.69 | 3.72 | 0.356 | 15.9 |
| :---: | :---: | :---: | :---: | :---: |
| PTQ10 | 1.78 | 3.53 | 0.258 | 21.9 |

Figure S3. Optical micrographs of PM6, PTQ10, and N3 neat films were on PDMS by transferred from glass. The cracks on the films are highlighted by black arrows.

Figure S4. Optical micrographs of PM6, N3, and P(NDI2OD-T2) neat films under 5\% strain compression.

Table S3. The relative degree of crystallinity ( $r$ DoC) values of (010) $\pi-\pi$ stacking peaks of PM6 and PTQ10.

| Neat Films | PM6 | PTQ10 |
| :---: | :---: | :---: |
| $r D o C$ | 0.84 | 1 |

Table S4. The crack-onset strain and elastic modulus of PM6, PTQ10, and N3 neat films obtained by the FOE method.

| Neat Films | PM6 | PTQ10 | N 3 |
| :---: | :---: | :---: | :---: |
| COS (\%) | $24.2 \pm 1.3$ | $25.2 \pm 1.7$ | $1.5 \pm 0.3$ |
| E (GPa) | $1.05 \pm 0.10$ | $0.71 \pm 0.07$ | $1.49 \pm 0.16$ |

Table S5. The parameters extracted from the PSD profiles of PM6:PTQ10:N3 blend films with varied PTQ10 contents.

| PTQ10 in Donors | $0 \%$ | $20 \%$ | $40 \%$ | $60 \%$ | $80 \%$ | $100 \%$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{q}\left(\mathrm{nm}^{-1}\right)$ | 0.243 | 0.211 | 0.186 | 0.221 | 0.224 | 0.236 |
| $\mathrm{~d}(\mathrm{~nm})$ | 25.8 | 29.8 | 33.8 | 28.4 | 28.0 | 26.6 |

Table S6. The peak position and CL in OOP directions of PM6:N3 blend film.
(010) peak $\quad$ Position $\left(\AA^{-1}\right) \quad \begin{gathered}\text { Stacking } \\ \text { distance }(\AA)\end{gathered} \quad$ FWHM $\left(\AA^{-1}\right) \quad C L(\AA)$

| $(010)$ peak of PM6 | 1.70 | 3.69 | 0.27 | 20.9 |
| :---: | :---: | :---: | :---: | :---: |
| $(010)$ peak of N3 | 1.80 | 3.49 | 0.24 | 23.3 |

Table S7. The peak position and CL in OOP directions of PM6:PTQ10:N3 blend film.

| (010) peak | $\operatorname{position}\left(\AA^{-1}\right)$ | Stacking <br> distance $(\AA)$ | FWHM $\left(\AA^{-1}\right)$ | $C L(\AA)$ |
| :---: | :---: | :---: | :---: | :---: |
| (010) peak of PM6 | 1.69 | 3.71 | 0.20 | 28.1 |
| (010) peak of PTQ10 <br> and N3 | 1.80 | 3.49 | 0.21 | 27.3 |

Table S8. The peak position and CL in OOP directions of PTQ10:N3 blend film.

| Sample | Position $\left(\AA^{-1}\right)$ | Stacking Distance $(\AA)$ | FWHM $\left(\AA^{-1}\right)$ | $C L(\AA)$ |
| :---: | :---: | :---: | :---: | :---: |
| PTQ10:N3 | 1.79 | 3.49 | 0.25 | 22.7 |

Table S9. The $r D o C$ values of (100) lamellar stacking peaks and (010) $\pi-\pi$ stacking peaks of three blend films.

| Sample | PM6:N3 | PM6:PTQ10:N3 | PTQ10:N3 |
| :---: | :---: | :---: | :---: |
| $r D o C(100)$ | 0.76 | 1 | 0.80 |
| $r D o C(010)$ | 0.78 | 1 | 0.82 |

Figure S8. The schematic of equivalent box model (EBM) for three-component blends. $\Phi_{p}=\Phi_{p, 1}+\Phi_{p, 2}+\Phi_{p, 3}, \Phi_{s}=\Phi_{s, 1}+\Phi_{s, 2}+\Phi_{s, 3}$

[^0]:    ${ }^{\text {a) }}$ Coherence lengths $(C L)$ were calculated using the Scherrer equation of diffraction peaks: $C L=2 \pi k / \Delta q$, where k is the dimensionless shape factor (herein $k=0.9$ ) and $\Delta q$ was the full width at half maximum (FWHM) of the given peak.
