Materials

Citric acid anhydrous, Urea, 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC.HCl), Cumarin-153, Quinine sulphate, Dimethyl Sulfoxide-d₆ were purchased from Sigma-Aldrich. All the organic solvents were obtained from Sisco Research Laboratories (SRL, India). Chemicals are used as received. Millipore water was used for synthesis and dilutions during spectroscopic analysis.

Instrumentation

The morphological characterization was done by Atomic Force Microscopy (AFM, Model: Keysight 5500 Scanning Probe Microscope and Agilent Technologies 5500), Transmission Electron Microscopy (TEM, Model: JEM-F200), and Field Emission Scanning Electron Microscopy (FESEM, Model: Gemini SEM 500 microscope, ZEISS). The topography images were captured in the non-contact mode after the spin coating on a silicon wafer. TEM analysis was done after the drop-casting of a diluted sample on a carbon-coated copper TEM grid. FESEM images were also acquired after the spin coating of the sample on a silicon wafer followed by gold coating. The hydrodynamic diameter of the samples was analyzed by Anton Paar (Litesizer 500) instrument. Reverse Phase High-Performance Liquid Chromatography (RP-

HPLC) was done on a Shimadzu Prominence analytical HPLC system. The mobile phase contained (95:5) % of 10mM Tris.HCl buffer (pH 7.4) as eluent A and acetonitrile as eluent B. The flow rate was 0.2 ml/min with 25±1 °C column temperature and 10 µl injection volumes. Powder XRD (p-XRD, Model: Empyrean, Malvern Panalytical) analysis of the CPD was done with Cu-K α ($\lambda=1.54\text{\AA}$) X-ray source. Fourier transform- infrared spectroscopy (FT-IR, Model: Parkin Elmer Spectrum-400) experiment was done on KBr mode within the range of 400-4000 cm $^{-1}$. UV-Visible absorption spectra data were recorded on a UV-2550 spectrophotometer (Shimadzu, Japan). Steady-state fluorescence spectra were done on a Fluoromax-400 spectrofluorometer (Horiba, Japan). Time-resolved fluorescence decay was measured by a time-resolved fluorescence spectrophotometer from Edinburgh Instruments (LifeSpec-II, UK) working on the time-correlated single-photon counting (TCSPC) technique. Raman spectra (STR 750 RAMAN spectrograph, Seki Technotron Corporation Japan) were recorded with a 633 nm laser. NMR experiment was done on a BRUKER NMR AVANCE-400 MHz. Digital images were taken on a Canon D60 digital camera exposed to a UV transilluminator. For the determination of the quantum yield of CPD in water, a solution of quinine sulfate (QY= 0.55) in 0.5 M H₂SO₄ was used as standard. Quantum yield was calculated by using the following equation,

$$\Phi_x = \Phi_s \times (I_x f_s \eta_x^2 / I_s f_x \eta_s^2)$$

Where subscript x and s denote test and standard sample respectively; Φ is fluorescence quantum yield; I is the integrated fluorescence intensity; f is absorption factor ($f = 1 - 10^{-A}$, where A = absorbance); and η is the refractive index of the solvent. For QY calculation of green-CPD, we used coumarin-153 as a standard.

Confocal Microscopy:

Incubated cells were washed thrice in 1×PBS (pH 7.4) by centrifuging at 300×g for 5 min. The washed cells were fixed with 4% paraformaldehyde for 4 min. The cells were again washed 3× in 1×PBS. 10 µl of the cell pellet was placed on a clean microscopic slide and stained with DAPI to stain the nucleus and mounted in ProLong Gold Antifade mounting solution (Invitrogen). The slides were then examined using LSM 880 confocal microscope (Zeiss). Stained cells were viewed at 405, 458, and 543 excitations and 460, 519, and 621 nm emissions.
