

Supplementary information

Chemicals and reagents

1,3,5-Tris(4-aminophenyl) benzene (TAPB), trifluoroacetic acid (TFA), Albumin from bovine serum (BSA), Horseradish peroxidase (HRP), iodoacet-amide (IAA), dithiothreitol (DTT), and trypsin were purchased from Sigma-Aldrich (USA). Iron chloride hexahydrate ($\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$), ethylene glycol (EG), anhydrous sodium acetate (NaAc), 2,5-Dihydroxybenzoic acid (DHB), ammonium 2-Aminoterephthalic acid ($\text{H}_2\text{BDC-NH}_2$), Sodium hydroxide (NaOH), Phosphosserine (PS), Succinic anhydride (SA), and bicarbonate (NH_4HCO_3) were purchased from Aladdin (Shanghai, China). PNGase F was obtained from Genetimes Technology (Shanghai, China). Acetonitrile (ACN), acetic acid (HAc), anhydrous tetrahydrofuran (THF), ethanol (EtOH), 2,5-Dihydroxyterephthalaldehyde (Dta), and Zirconium oxychloride octahydrate ($\text{ZrOCl}_2 \cdot 8\text{H}_2\text{O}$) were purchased from Macklin (Shanghai, China). Acetone was obtained from HUZHOU SHUANGLIN CHEMICAL TECHNOLOGY CO., LTD. The serums were obtained from The Affiliated Hospital of Medical School, Ningbo University, with the approval from its Ethics Committee (KS20227002).

Pre-treatment of samples

5 mg of HRP was dissolved in 0.5 mL of H_2O and denatured at 100 °C for 10 min. Then NH_4HCO_3 (50 mM, 0.5 mL) and Trypsin (1mg mL^{-1} , 0.125 mL) were added, and the HRP tryptic digest was obtained by enzymolysis at 37 °C for 16 h.

According to the classical method, BSA is pretreated with DTT and IAA. The BSA (50 mg) dispersed in NH_4HCO_3 (50 mM, 2.5 mL) was boiled and denatured at 100 °C for 10 minutes. A mixture of DTT (200 mM, 0.25 mL) and NH_4HCO_3 (50 mM, 2.25 mL) is then added and shaken at 37 °C for 1 h. Finally, trypsin (1mg mL^{-1} , 125 μL) was added and subjected to enzymatic degradation

for 16 h at 37 °C away from light.

1 mg serum was diluted in NH₄HCO₃ (50 mM) buffer and denatured in 100 °C boiling water for 15 min. The mixture was reduced by DTT at 37 °C for 1 h and alkylated by IAA at 37 °C for 1 h in the dark. Then the obtained mixture was incubated with trypsin (trypsin/protein is 1/40, w/w) at 37 °C for 16 h. Tryptic digests were lyophilized for further enrichment and analysis.

Enrichment procedures for standard samples and actual samples

1 mg of Fe₃O₄@COF@MOF-PS was ultrasonically dispersed in 100 µL of loading buffer (ACN: TFA: H₂O = 95:1:4, V/V/V), 500 µg of biosample digest was added and the solution was shaken for 2 h at 37 °C. The supernatant was removed by centrifugation and washed several times with loading buffer (ACN: TFA: H₂O = 95:1:4, V/V/V). Then 10 µL of eluting buffer (ACN: TFA: H₂O = 30:0.1:69.9, V/V/V) was added and incubated at 37 °C for 1 h and repeated again. The eluate was collected, desalting and lyophilized for later use.

MALDI-TOF MS and Nano-LC-MS/MS analysis

An autoflex maX (Bruker Daltonics, U.S.A) was used for the MALDI-TOF MS analysis, and the spectra were gained in positive ion mode with an Nd:YAG laser (383 nm). The repetition rate was 1000 Hz and the acceleration voltage was 20 kV. The concentration of matrix DHB was 10 mg mL⁻¹, (Solvent with ACN/H₂O/TFA = 20/79.9/0.1, v/v/v).

The experiments were conducted on an EASY-nLCTM 1200 system (Thermo Scientific, USA) coupled with an Orbitrap Fusion Lumos mass spectrometer (Thermo Finnigan, San Jose, CA) with nanoelectrospray ion source. Solvent A (water with 0.1% formic acid) and solvent B (ACN with 0.1% formic acid) were prepared. The deglycosylated peptides (10 µL) were loaded by the autosampler into the trap column (Thermo Scientific, 100 µm × 2 cm, 5 µm, 100 Å, °C18), with a

flow of 8 μ L/min for 4 min and subsequently separated on the analytical column (Thermo Scientific, 75 μ m \times 25 cm, 5 μ m, 100 A, °C18). The relevant liquid gradient was as follows: from 0 min to 40 min, the linear gradient was from 5% B to 28% B; from 40 min to 42 min, the linear gradient was from 28% B to 90% B, and from 42 min to 60 min, solvent B was kept at 90%. The flow rate was 300 nL/min, and the column temperature was maintained at 40 °C. The electrospray voltage was operated at 2.0 kV with the ion transfer capillary at 300 °C. The mass spectrometer was run in positive mode. Full-scan MS spectra (m/z 350–1800) were acquired in the Orbitrap with a resolution of 120,000 at m/z 200, scan mode set at top speed, the microscans were set at 1. The AGC target was set to 4e5, and the maximum injection time was 50 ms, the number of scan ranges set at 1, dynamic exclusion of 40.0 s, data-dependent mode set at cycle time, and the time between master scans set at 3 s. The mass-to-charge ratios of peptides and peptide fragments were gathered in line with the following strategy: the MS2 scan was performed at the same time as the master scan, the cycle time was 3 s. The intensity threshold was 5e4 and the MS2 activation type was HCD, the MS2 resolution was 50,000 at m/z 200. The microscans were set at 1, the maximum injection time was 105 ms, and the AGC target was set to 1e5. The isolation window was 1.6 m/z , the HCD collision energy was 35%

and first mass was set at 110 m/z .

Database search and data analysis

The original data of mass spectrometry analysis was RAW file, and the built-in software Proteome Discoverer 2.4 (Thermo Scientific) was used for library identification and quantitative analysis. The uniprot database is used this time: uniprot_human_20210621_202249.fasta. When searching the library, submitting the RAW file to SequestHT through Proteome Discoverer,

selecting the established database, and then searching the database. The search parameters were as follows: monoisotopic mass, trypsin digestion, maximum 2 missing cut sites, peptides Charged number: 2+, 3+ and 4+, fixed modification to carbamidomethylation (C), dynamic modification to oxidation (M), Acethyl (protein N-term) and Deamidated [N]. The maximum error of the precursor ion was 10 ppm, and the maximum error of the fragment ion was 0.05 Da. Proteome Discoverer 2.4 performs Peptide high Confidence screening based on the peptide identification results and outputted the results.

Fe₃O₄@COF@MOF-PS characterization

Scanning electron microscopy (SEM, Keol 2012 microscope), transmission electron microscopy (TEM, JEOL 1011 microscopy and JEM-1400plus, Japan), Fourier transform infrared spectra (FT-IR, Thermo Fisher Scientific 10 infrared spectrometer analysis), X-ray diffraction (XRD, Bruker XRD (D4)), water contact angles (Dataphysics OCA20, Germany). X-ray photoelectron spectroscopy (XPS) by operating a Thermo Kalpha X-ray photoelectron spectrometer were employed to identify the existence of certain specific elements.

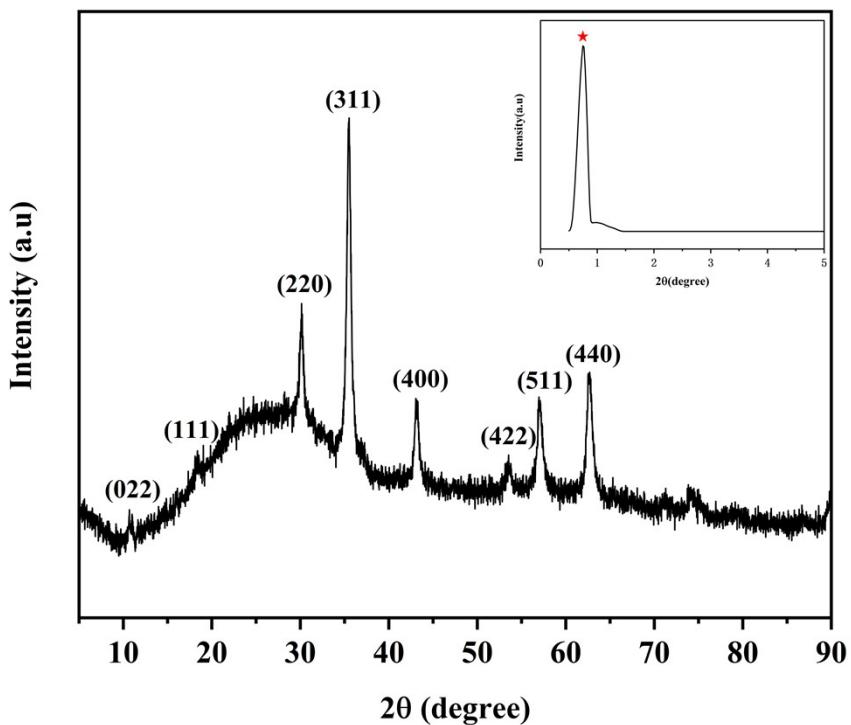

Fig. S1. The XRD analysis spectra of $\text{Fe}_3\text{O}_4@\text{COF}@\text{MOF-PS}$. “★” indicates peaks associated with COF.

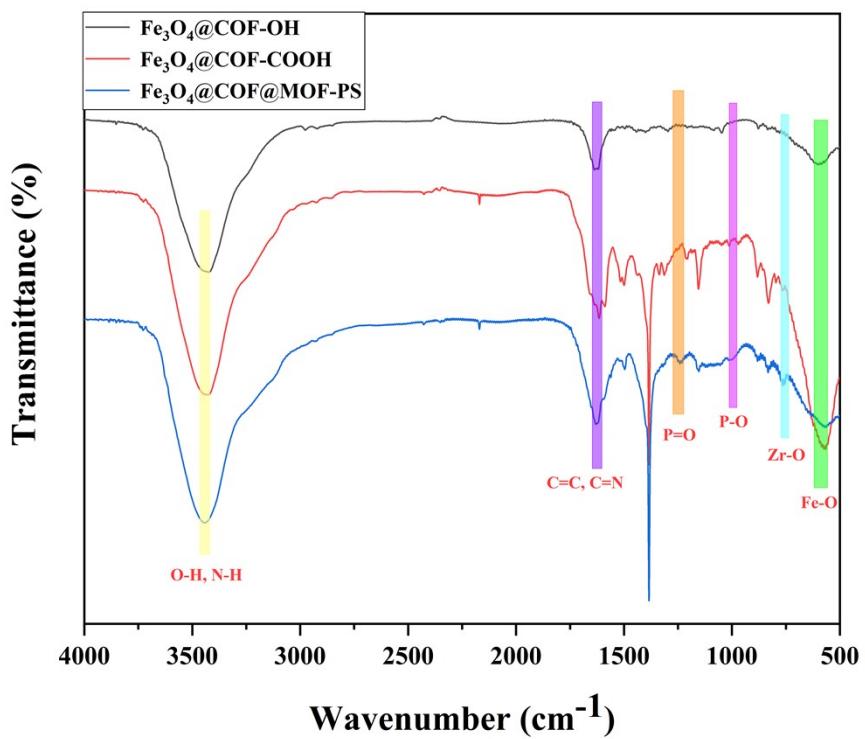

Fig. S2. The FT-IR spectra of $\text{Fe}_3\text{O}_4@\text{COF}@\text{MOF-PS}$.

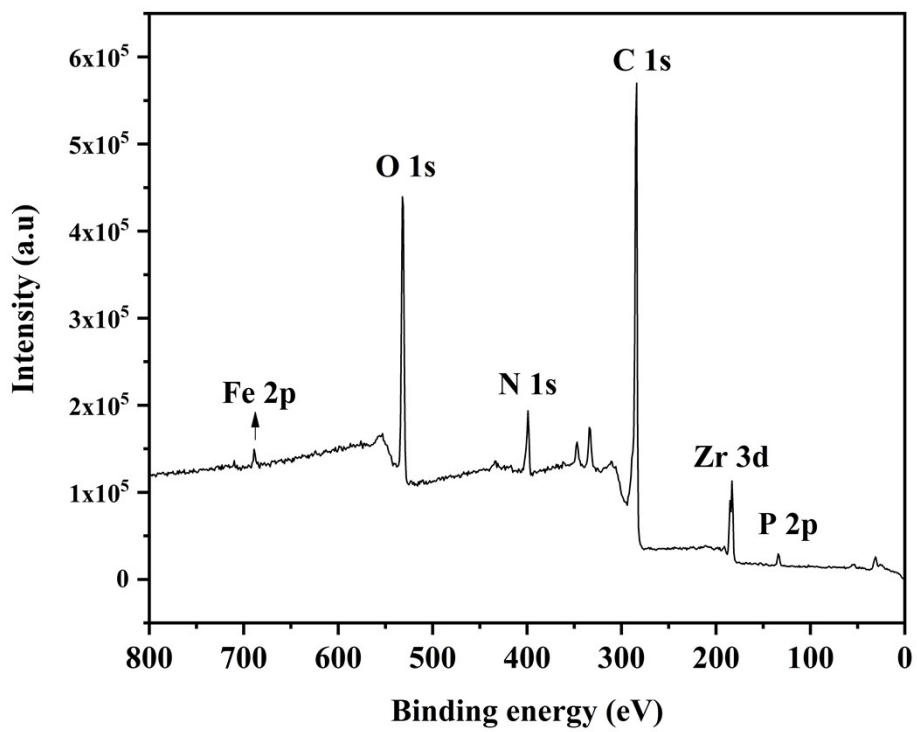

Fig. S3. The XPS image of $\text{Fe}_3\text{O}_4@\text{COF}@\text{MOF-PS}$.

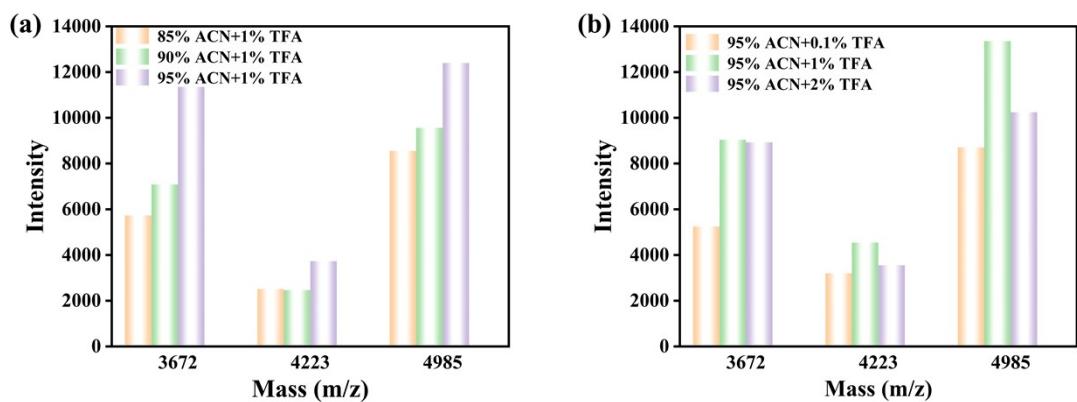

Fig. S4. Optimization of enrichment of N-glycopeptides (a, b) by $\text{Fe}_3\text{O}_4@\text{COF}@\text{MOF-PS}$ with different loading buffer.

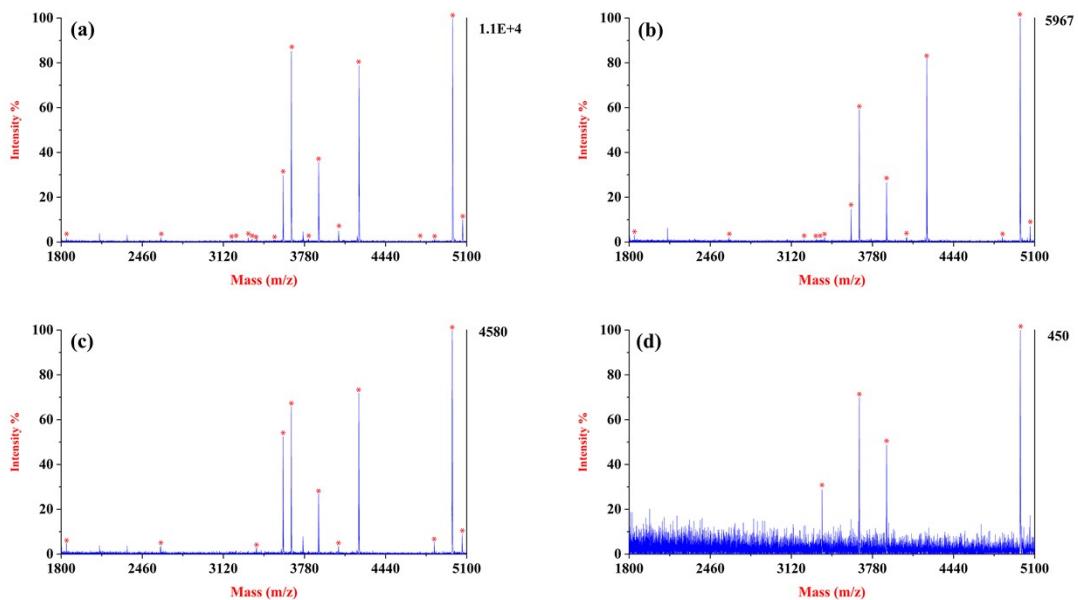

Fig. S5. MS spectra of the mixture of HRP tryptic digest and BSA protein with a mass ratio after the enrichment by $\text{Fe}_3\text{O}_4@\text{COF}@\text{MOF-PS}$: (a) 1:250, (b) 1:1000, (c) 1:5000, and (d) 1:10000. N-glycopeptides peaks are signed as “*”.

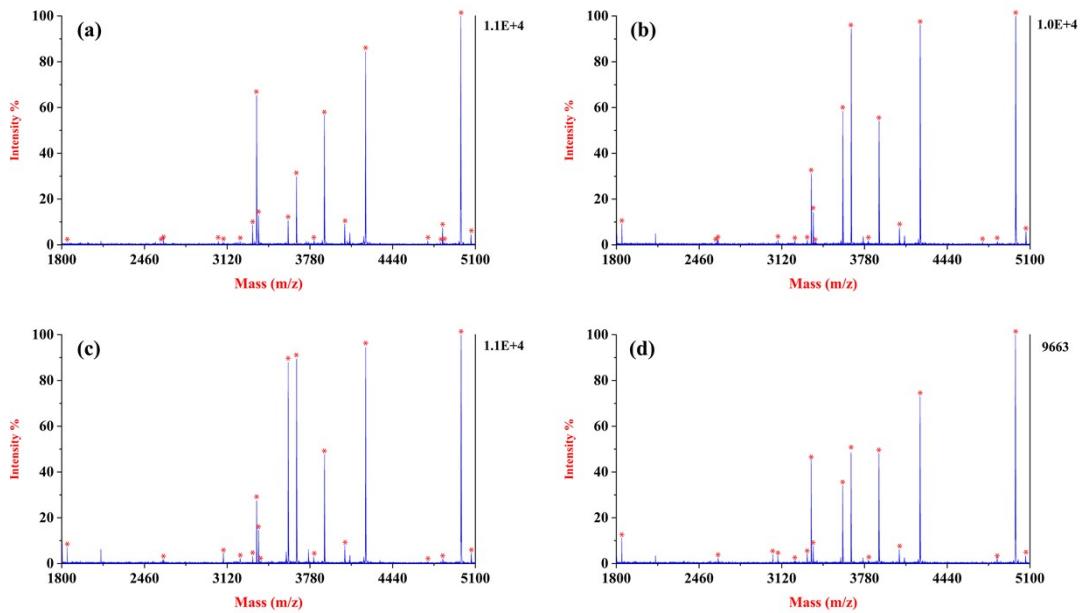

Fig. S6. MS spectra analysis of glycopeptides from HRP tryptic digest after enriched by Fe₃O₄@COF@MOF-PS: (a) The first time, (b) The fourth time, (c) The seventh time, and (d) The tenth time. N-glycopeptides peaks are signed as “*”.

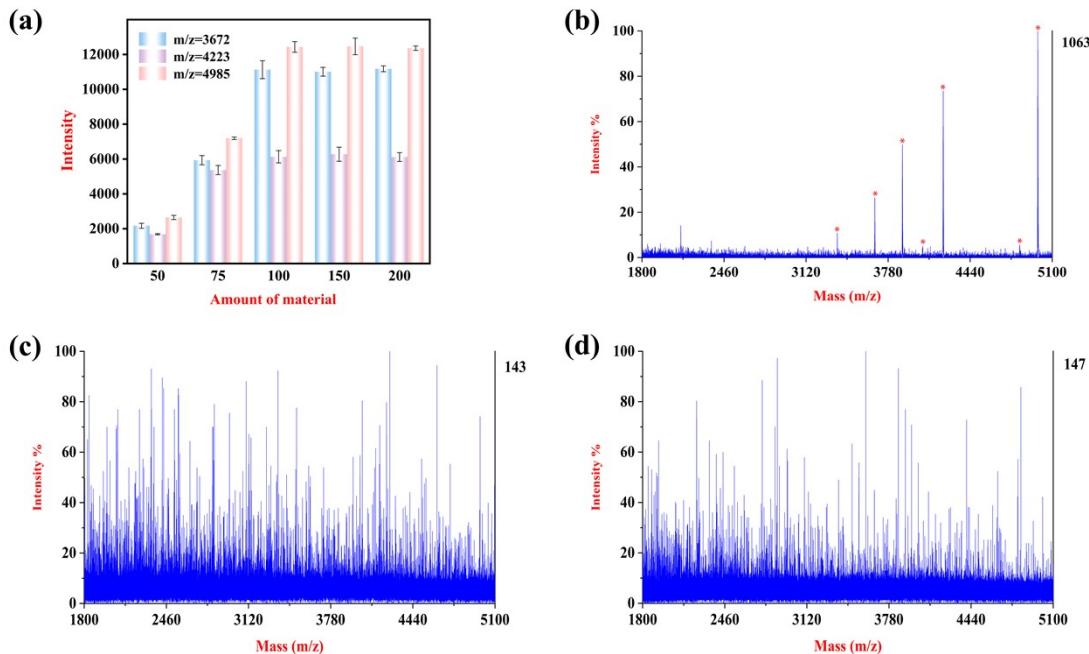

Fig. S7. (a) The loading capacity of $\text{Fe}_3\text{O}_4@\text{COF}@\text{MOF-PS}$ for N-glycopeptides: different amounts of material (50, 75, 100, 150, and 200 µg) were used to enrich N-glycopeptides from the same amount of HRP digests. MS spectra of the supernatant after the loading capacity experiment was enriched again by $\text{Fe}_3\text{O}_4@\text{COF}@\text{MOF-PS}$: (b) 75 µg, (c) 100 µg, and (d) 150 µg. N-glycopeptides peaks are signed as “*”.

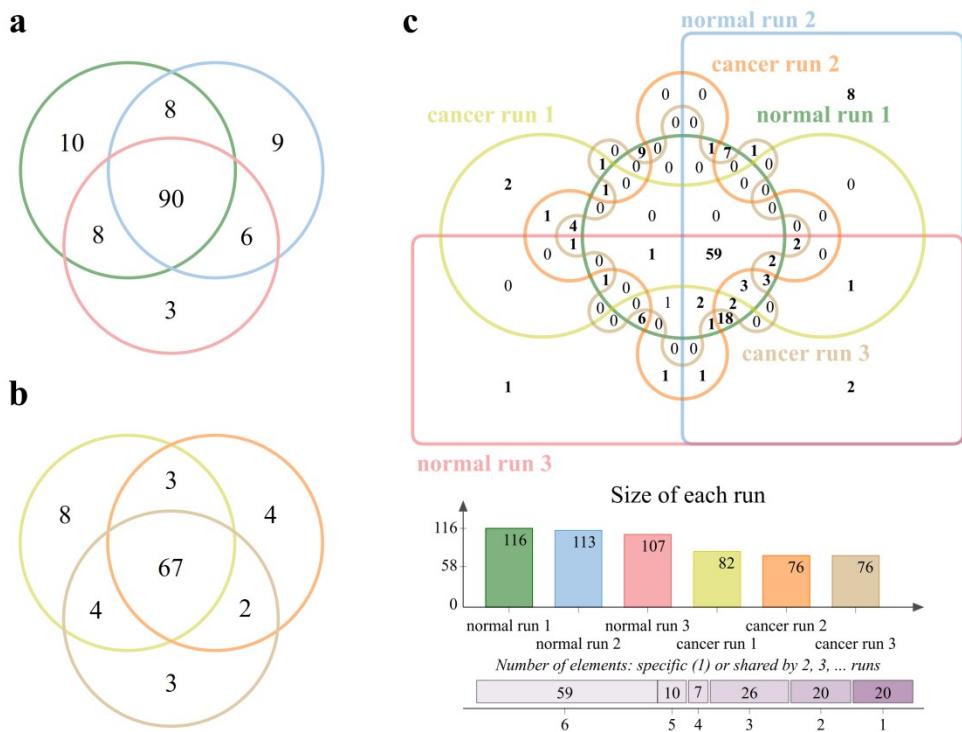

Fig. S8. Venn diagrams of the identified glycoproteins: a) enriched from healthy person ($n = 3$); b) enriched from cervical cancer patient ($n = 3$); c) enriched from healthy person and cervical cancer patient.

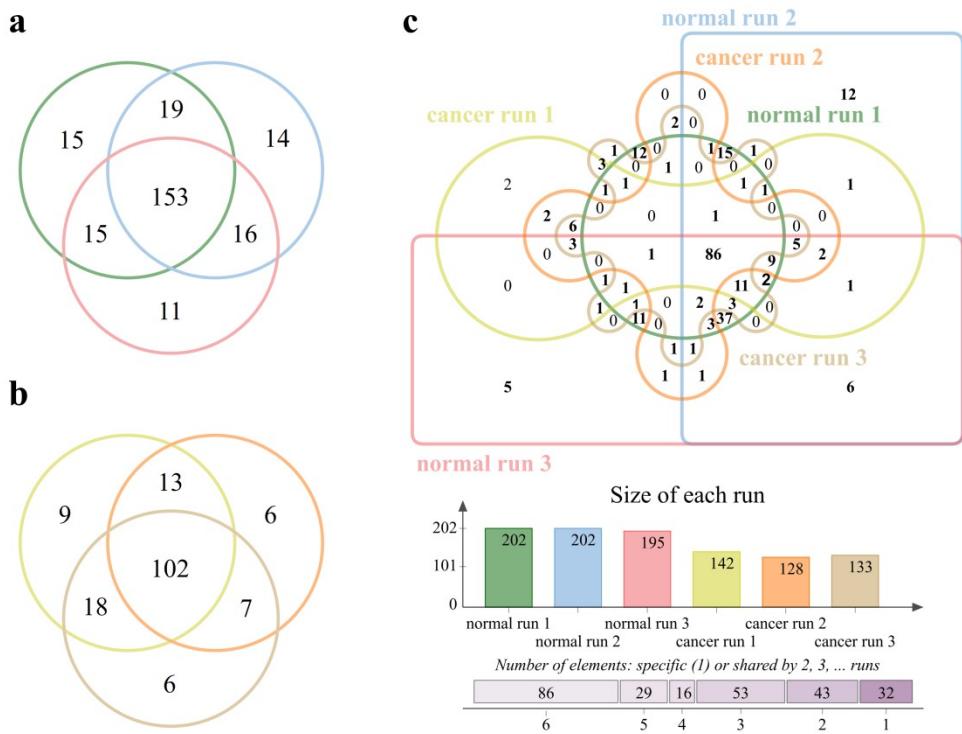

Fig. S9. Venn diagrams of the identified glycosylation sites: a) enriched from healthy person (n = 3); b) enriched from cervical cancer patient (n = 3); c) enriched from healthy person and cervical cancer patient.

Table S1. Detailed information of the observed N-glycopeptides derived from HRP tryptic digest.

“N#”: N-glycosylation site.
