Determination of total sugar content by phenol sulfuric acid method

Glucose reference substance (25 mg) was accurately weighed and dissolved in a 100 mL brown volumetric flask. Accurately took 2 mL, 4 mL, 6 mL, 8 mL and 10 mL of the reference solution in a 25 mL brown volumetric flask respectively. Took 2 mL of glucose solution of different concentration into a brown reagent bottle, added 1.22 mL of phenol solution (6%) and 5 mL of concentrated sulfuric acid. Mixed them evenly. After 20 minutes, the absorbance was measured with ultraviolet spectrophotometer at 490 nm with reagent blank reference solution. The standard curve of absorbance to glucose concentration was regressed.

Accurately weighed cinnamon polyphenol extract sample in brown volumetric flask, added water to dissolve, ultrasonic mixing, cooled down, diluted it with water to the scale and shaken up. Accurately took 5 mL of the reference solution in a 25 mL brown volumetric flask. Took 2 mL of solution, added 1.22 mL of phenol solution (6%) and 5 mL of concentrated sulfuric acid, and mixed them evenly. The absorbance was measured at 490 nm with the reagent blank reference solution.
