

Supporting Information

Experimental Details

Enrichment of glycopeptides/phosphopeptides from serum

For the enrichment of glycopeptides from serum, 1 mg of CH-Dha@Ti⁴⁺ was ultrasonically dispersed in 100 µL of loading buffer (ACN/H₂O/TFA = 90/9/1, v/v/v), 500 µg of biological sample digest were added, and the solution was shaken at 37°C for 30 min. The supernatant was removed by centrifugation and washed with loading buffer several times. Then 10 µL of eluting buffer (ACN/H₂O/TFA = 30/69.9/0.1, v/v/v) was added and incubated at 37°C for 30 min and repeat it again. The eluate was collected, desalted, and lyophilized for further nano LC-MS/MS analysis.

For the enrichment of phosphopeptides from serum, 1 mg of CH-Dha@Ti⁴⁺ was ultrasonically dispersed in 100 µL of loading buffer (ACN/H₂O/TFA = 50/49/1, v/v/v), 500 µg of biological sample digest were added, and the solution was shaken at 37°C for 30 min. The supernatant was removed by centrifugation and washed with loading buffer several times. Then 10 µL of eluting buffer (0.4 M NH₃·H₂O) was added and incubated at 37°C for 30 min and repeat it again. The eluate was collected, desalted, and lyophilized for further analysis using nano LC-MS/MS.

MALDI-TOF MS analysis

All experiments of glycopeptides from standard protein tryptic digest by CH-Dha@Ti⁴⁺ were recorded by MALDI-TOF MS (Bruker, USA). The instrument was

worked by an advanced Nd:YAG laser (355 nm), with an acceleration voltage (20kV) of TOF and a detection frequency (1000 Hz). Within the detection range of mass-to-charge ratio (1000-5000 Da), DHB (20 mg/mL, ACN/H₂O = 30/70, v/v) was selected as the matrix.

Sample processing

Add 20 μL of 0.1% FA to the sample to reconstitute, shake to dissolve, centrifuge at 14000 g, and take the supernatant for testing.

Nano LC-MS/MS analysis

Liquid phase A was a 0.1% formic acid aqueous solution, and B was a 0.1% formic acid acetonitrile solution (acetonitrile is 100%). Column Thermo Scientific analytical column (75 μm×25 cm, 5 μm, 100 Å, C18) was equilibrated with 95% A liquid. The sample was loaded by the autosampler to the Thermo Scientific EASY trap column (100 μm×2 cm, 5 μm, 100 Å, C18), and then separated by the chromatographic column. The relevant liquid gradient was as follows: from 0 min to 40 min, linear gradient of liquid B was from 5% to 28%; from 40 minutes to 42 minutes, the linear gradient of liquid B was from 28% to 90%; and from 42 minutes to 60 minutes, the liquid B was maintained at 90%. The enzymatic hydrolysis products were desalted and separated by capillary high performance liquid chromatography, and then analyzed by mass spectrometry using the Orbitrap Fusion Lumos mass spectrometer (Thermo Finnigan, San Jose, CA). Analysis time: 60min, detection method: positive ion, precursor ion scan range: 375-1800 m/z, primary mass

spectrometry resolution: 120,000 at m/z 200, scan mode: Top-Speed, AGC target: 4e⁵, first-level Maximum IT: 50 ms, Number of scan ranges: 1, Dynamic exclusion: 40.0 s, Data Dependent Mode: Cycle Time, Time between Master Scan: 3s. The mass-to-charge ratios of peptides and peptide fragments were collected according to the following method: the secondary spectrum scan (MS2 scan) was performed at the same time as each primary scan (Master scan), the scanning cycle was 3s, MS2 Activation Type: HCD, secondary mass spectrometry Resolution: 50,000 at m/z 200, Microscans: 1, Level 2 Maximum IT: 105 ms, AGC target: 1e⁵.

Data analysis

The original data for mass spectrometry analysis was a RAW file, and the built-in software Proteome Discoverer 2.4 (Thermo Scientific) was used for library identification and quantitative analysis. The uniprot database is used this time: uniprot_human_20210621_202249.fasta. When searching the library, submitting the RAW file to SequestHT through Proteome Discoverer, selecting the established database, and then searching the database. The search parameters were as follows: monoisotopic mass, trypsin digestion, maximum 2 missing cut sites, peptides charged number: 2⁺, 3⁺ and 4⁺, fixed modification to carbamidomethylation (C), dynamic modification to oxidation (M), Acethyl (protein N-term) and Deamidated [N]. The maximum error of the precursor ion was 10 ppm, and the maximum error of the fragment ion was 0.05 Da. Proteome Discoverer 2.4 performs peptide high confidence screening based on the peptide identification results and outputs the results.
