2. Synthetic protocols ..... S9
3. Spectroscopic data: isolated intermediates, Compounds 1-3 and III ..... S15
4. Cellular Imaging and MTT assays ..... S46
5. Structural Investigations of Compound 3-BPin by Gas Phase DFT Calculations ..... S63
6. Structural Investigations of 3-BPin by Single Crystal X-ray Diffraction Analysis. .....  S68

## 1. General Experimental Methods.

Solvents and reagents were reagent grade unless stated otherwise and were purchased from Acros Organics, Avocado Research Chemicals Ltd, Fisher Scientific UK, Frontier Scientific Europe Ltd, Alfa Aesar, TCI, Lancaster Synthesis Ltd and Sigma-Aldrich Company Ltd and were used without further purification, unless stated otherwise. Anhydrous solvents were collected from the SPS system. Purification of products by flash chromatography was carried out using $\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{CH}_{3} \mathrm{OH}, 50: 1$, v/v.

Nuclear magnetic resonance spectra were performed in DMSO- $\mathrm{d}_{6}$, MeOD- $\mathrm{d}_{4}$ or $\mathrm{CDCl}_{3}$. ${ }^{1} \mathrm{H},{ }^{11} \mathrm{~B}$ and ${ }^{13} \mathrm{C}$ spectra were measured using a Bruker AVANCE 250, Bruker AVANCE 300, Bruker AVANCE 400 or Bruker AVANCE 500 spectrometer. ${ }^{1} \mathrm{H}$ spectra were recorded at 300.22 MHz or $500.13 \mathrm{MHz},{ }^{11} \mathrm{~B}$ spectra at 96.32 MHz and ${ }^{1} \mathrm{H}\left\{{ }^{13} \mathrm{C}\right\}$ at 69.5 or 75.5 MHz . Some titration experiments were recorded Chemical shifts ( $\delta$ ) are expressed in parts per million and are reported relative to the residual solvent peak or to tetramethylsilane as an internal standard in ${ }^{1} \mathrm{H}$ and ${ }^{1} \mathrm{H}^{18}$ spectra, or boron trifluoride diethyl etherate as an external standard in ${ }^{11} \mathrm{~B}$ spectra. The multiplicities and general assignments of the spectroscopic data are denoted as: singlet (s), doublet (d), triplet, (t), quartet (q), doublet of doublets (dd), doublet of triplets (dt), triplet of triplets ( tt ), unresolved multiplet (m), apparent (app), broad (br) and aryl (Ar). Coupling constants (J) are expressed in Hertz.

High resolution mass spectra were recorded by the EPSRC National Mass Spectrometry Service Centre, Swansea. Low resolution EI and CI measurements were performed on a Micromass Quattro II triple quadrupole instrument, with ammonia as the CI reagent gas. Electron impact (EI) and chemical ionisation (CI) analyses were performed in positive ionisation mode. Electrospray ionisation measurements were performed in both positive and negative ionisation modes (ESI + and ESI - respectively). High resolution ESI + and ESI measurements were conducted on the micrOTOFQ electrospray time-of flight (ESI-TOF) mass spectrometer (Bruker Daltonik GmbH) at the University of Bath. The micrOTOFQ spectrometer was coupled to an Agilent Technologies 1200 LC system. $10 \mu \mathrm{~L}$ of sample was directly injected into the mass spectrometer. The nebulising gas used was nitrogen, which was applied at a pressure of 1 bar. Nitrogen was also used as a drying gas, supplied at a flow rate of $8 \mathrm{~L} / \mathrm{min}$ and a temperature of $110^{\circ} \mathrm{C}$.
HPLC was performed using a Gilson HPLC system using a Dionex C18 Acclaim column (5 $\mu \mathrm{M}, 4.6 \times 150 \mathrm{~mm}$ ). A 15 minute gradient method was applied using $\mathrm{H}_{2} \mathrm{O} / \mathrm{MeCN}$ containing $0.1 \%$ TFA as mobile phases with the following conditions: flow rate $1 \mathrm{~mL} / \mathrm{min}, 0 \mathrm{~min} 20 \%$ $\mathrm{MeCN} ; 1 \mathrm{~min} 20 \% \mathrm{MeCN} ; 4 \min 95 \% \mathrm{MeCN} ; 11.5 \mathrm{~min} 95 \% \mathrm{MeCN} ; 13.5 \min 15 \% \mathrm{MeCN}$, $15 \mathrm{~min} 15 \% \mathrm{MeCN}$. Absorbance was measured at 254 nm and 350 nm .

Steady-state fluorescence measurements were performed on a Perkin-Elmer Luminescence Spectrophotometer LS 50B, utilising Starna Silica (quartz) cuvettes with 10 mm path lengths, four faces polished. Data was collected via the Perkin-Elmer FL Winlab software package. All pH measurements taken during fluorescence experiments were recorded on a Hanna Instruments HI 9321 Microprocessor pH meter which was routinely calibrated using Fisher Chemicals standard buffer solutions (pH 4.0 - phthalate, 7.0 - phosphate, and 10.0 borate). All solvents used in fluorescence measurements were HPLC or Fluorescence grade and Milli-Q water was used throughout. Relative quantum yields were determined by comparison with fluorescein in 0.1 M NaOH using the following formula: $\Phi_{\mathrm{S}}=$ $\Phi_{\mathrm{R}}\left(D_{\mathrm{S}} / D_{\mathrm{R}}\right)\left(A_{\mathrm{R}} / A_{\mathrm{S}}\right)\left(I_{\mathrm{R}} / I_{\mathrm{S}}\right)\left(\eta_{\mathrm{S}} / \eta_{\mathrm{R}}\right)^{2}$, where $\Phi$ is the relative quantum yield, D is the integrated area of the fluorescence emission peak, A is the absorption of the solutions at the excitation wavelength, I is the flux at the excitation wavelength used and $\eta$ is the solution refractive index. R and S subscripts refer to the reference and sample respectively. For stability
studies, stock solutions of complexes were prepared as 7.5 or 2.5 mM solutions in DMSO and diluted with RPMI serum, giving solutions of final concentration $7.5 \mu \mathrm{M}$ or $2.5 \mu \mathrm{M}$ concentrations. The solutions were kept at $37^{\circ} \mathrm{C}$ and UV/Vis and fluorescence spectra were recorded at time points $1 \mathrm{~min}, 1 \mathrm{~h}, 2 \mathrm{~h}, 4 \mathrm{~h}$, and 24 h .

Two photon (690-1000 nm) wavelength laser light was obtained from the mode locked titanium- sapphire laser Mira (Coherent Laser Co., Ltd.) produced by 180 femtosecond pulse frequency of 75 MHz . This laser-pumped solid-state continuous wave 532 nm laser (Verdi V18, Coherent Laser Co., Ltd.). This can also be used for the fundamental output of the oscillator $915 \pm 2 \mathrm{~nm}$. The laser beam was focused to a diffraction-limited spot by the water immersion UV calibration target (Nikon VC $\times 60$, NA1.2) and the specimen on a microscope stage of the modified Nikon TE2000-U, with UV illumination optical emission. The focused laser beam raster scanning used an X - Y galvanometer (GSI Lumonics Corporation). Fluorescence emission was collected without de-scanning, bypassing the scanning system and passed through a coloured glass (BG39) filter. In normal operation mode and line scan frame and pixel clock signal was generated with an external fast microchannel plate photomultiplier tube as detector (R3809-U, Hamamatsu, Japan) synchronisation. These were linked to a Time Correlated Single Photon Counting (TCSPC) PC module SPC830 for the lifetime measurements with 910 nm excitation and emission in the range between 360 and 580 nm . Lifetime calculations were obtained using SPCImage analysis software (Becker and Hickl, Germany) or Edinburgh Instruments F900 TCSPC analysis software. Preliminary singlephoton FLIM investigations were conducted using the Becker and HicklDCS120 system with a 40 ps 473 nm diode laser.

## Compound@glucan hybrid preparation:

A stock solution of compound ( $10 \mathrm{mM}, 1 \mathrm{~mL}$ ) dissolved in DMSO was added to b-D-glucan $(1 \mathrm{mg} / \mathrm{mL}, 1 \mathrm{~mL})$ in DMSO, the pH was adjusted to 7.4 using PBS buffer and the mixture was stirred at room temperature overnight, in a vial protected from light. This was used directly for 2-photon TCSPC and cellular imaging experiments.

## Cell culture:

Cell lines used in live cell imaging include cervical cancer cells (HeLa), and prostate cancer cells (PC-3). All cells lines were from American Type Cell Culture (ATCC). Cells were normally frozen at $-196^{\circ} \mathrm{C}$ in liquid nitrogen until required, then thawed quickly and incubated after the addition of fresh media at $37^{\circ} \mathrm{C}$ under $5 \%$ carbon dioxide environment. Eagle's Minimum Essential Medium (EMEM), Park Memorial Institute (RPMI) medium and Dulbecco's Modified Eagle's Medium (DMEM) were used as culture media. All media contained activated foetal calf serum (FCS) ( $10 \%$ for HeLa, PC-3), $0.5 \%$ penicillin/streptomycin ( $10,000 \mathrm{IU} \mathrm{mL}^{-1} / 10,000 \mathrm{mg} \mathrm{mL}^{-1}$ ) and $2.5 \%$ L-glutamine.

Cell subculture was performed once or twice per week depending on the confluence of the cells in the flask, the supernatant was aspirated. All attached cells were washed twice using phosphate buffered saline (PBS, $2 \times 10 \mathrm{~mL}$ ), (all solvents, buffer solutions and media were warmed to $37{ }^{\circ} \mathrm{C}$ in the water bath prior to addition) 5 mL of $0.25 \%$ trypsin (in PBS) was subsequently loaded and incubated at $37^{\circ} \mathrm{C}$ for 5 minutes. After trypsinisation, 6 mL serum medium was added to neutralise the excess trypsin and solution was centrifuged at 1000 rpm for 5 minutes. Afterwards, the supernatant was aspirated and resuspended with 5 mL serum medium. Cells were counted in a haemocytometer and seeded appropriately for different applications.

## Cellular viability assays:

After cell splitting, cells were seeded on a sterile 96 well plate ( $7 \times 10^{3}$ cells per well) and incubated for 48 hours to adhere. Compounds 1,2 and 3 were subsequently loaded at different concentrations into wells and cultured for another 48 hours. The concentration used were 250 $\mu \mathrm{M}$ ( $1 \%$ DMSO, $99 \%$ culture media ( $10 \% \mathrm{FCS}$ ) ), $100 \mu \mathrm{M}, 50 \mu \mathrm{M}, 10 \mu \mathrm{M}, 1 \mu \mathrm{M}, 0.5 \mu \mathrm{M}, 0.1$ $\mu \mathrm{M}$ and 1 nM . Subsequently, cells were washed with PBS and 3-(4, 5-dimethylthiazol-2-yl)-2, 5-diphenyltetrazolium bromide (MTT) was added ( $100 \mu \mathrm{~L}, 0.5 \mathrm{mg} / \mathrm{mL}, 1: 9$ PBS: serum-free medium (SFM)) followed by a two-hour incubation. After aspiration, $100 \mu \mathrm{~L}$ of DMSO was added and 96 well plates were read by an ELISA plate reader, Molecular Devices Versa Max (BN02877). The absorption wavelength was at 570 nm and 630 nm wavelength was used as a reference.

## Fluorescence microscopy

Method 1. For confocal- or epi-fluorescence microscopy cells were plated in glass-bottomed dishes as $1.5 \times 10^{5}$ cells per dish and incubated for 24 h for HeLa. Cells were washed 5 times with PBS, before adding SFM ( 2 mL ). Subsequently, a small volume of SFM was removed (e.g. $10 \mu \mathrm{~L}$ ) and compound in DMSO was added in equal volume to what was removed, to obtain a final volume of 2 mL and the desired concentration ( $500 \mathrm{mM}, 5 \%$ DMSO, 50 mM , $0.5 \%$ DMSO or $2 \mathrm{mM}, 0.5 \%$ DMSO). After minimum 20 min cells were washed 3 times with PBS and incubated in SFM prior to imaging

Fluorescence microscopy images were captured on a Nikon Eclipse TE2000-E epifluorescence or a Zeiss LSM510META microscope at University of Bath, whereas at the Rutherford Appleton Laboratory a modified Nikon TE2000-U was utilised. HeLa cells were cultured as above and plated in a glass bottomed petri dish (MaTek, 35 mm diameter and 1.5 mm thickness) at $1.5 \times 10^{5}-2.5 \times 10^{5}$ cells per dish depending on the cell line and culture time. Briefly, HeLa cells required 12 hours to attach onto the dish, whereas CHO and PC-3 needed 48 hours to adhere. Prior to the microscopy observation, cultured cells were washed with Hank's solution (HBSS) $(5 \times 1 \mathrm{~mL})$ and refilled with serum-free medium $(990 \mu \mathrm{~L})$. Prior to the probe labelling, a small volume of compound ( 10 mM or $1 \mathrm{mg} / \mathrm{mL}$ stock solution, $10 \mu \mathrm{~L}$ ) in DMSO was loaded to make the final volume 1 mL at the appropriate concentration. The final concentration on the plate was usually at $100 \mu \mathrm{M}$ with $1 \%-2 \%$ DMSO depending on the compound solubility. After 15 min to 1 -hour incubation at $37^{\circ} \mathrm{C}$ or $4^{\circ} \mathrm{C}$, cells were washed with HBSS three times and refilled with fresh SFM ( 1 mL ). Confocal images were captured immediately afterwards.

Method 2: Confocal fluorescence microscopy images were captured on modified Nikon TE2000-U at the OCTOPUS Facility, Research Complex at Harwell. HeLa or PC3 cells were cultured as above and plated in a glass bottomed petri dish (MaTek, 35 mm diameter and 1.5 mm thickness) at $1.5 \times 10^{5}-2.5 \times 10^{5}$ cells per dish depending on the cell line and culture time. Briefly, HeLa cells required 12 hours to attach onto the dish, whereas PC3 needed 48 hours to adhere. Prior to the microscopy observation, cultured cells were washed with Hank's solution (HBSS) five times and refilled with $990 \mu \mathrm{~L}$ of serum-free medium. Prior to the probe labelling, a small volume of compound ( 10 mM or $1 \mathrm{mg} / \mathrm{mL}$ stock solution, $10 \mu \mathrm{~L}$ ) in DMSO was loaded to make the final volume 1 mL at the appropriate concentration. The final concentration on the plate was usually at $100 \mu \mathrm{M}$ with $1 \%-2 \%$ DMSO depending on the compound solubility. After 15 min to 1 -hour incubation at $37^{\circ} \mathrm{C}$ or $4^{\circ} \mathrm{C}$, cells were washed with HBSS three times and refilled with fresh SFM ( 1 mL ). Confocal images were captured immediately afterwards.

## Colocalization tests:

Several commercial (Invitrogen) cellular organelles tracking dyes were used to localise distribution of samples via confocal microscopy; all dyes in the following studies were purchased from Invitrogen. Cells were cultured in Eagle's Minimum Essential Medium (EMEM) or Roswell Park Memorial Institute (RPMI)-1640 medium using standard protocols described above. Prior to addition of any commercial co-localisation dye, cells were washed five times with HBSS. Protocols were adapted from Invitrogen.
i) Staining with Hoechst solution. The Hoechst co-localisation dye solution $(10 \mathrm{mg} / \mathrm{mL})$ was prepared by dissolving 10 mg Hoechst 33342 (as supplied by Invitrogen) in 1 mL of sterile MilliQ water, $10 \mu \mathrm{~L}$ of the stock solution was dissolved into $990 \mu \mathrm{~L}$ sterile water to make a $100 \mu \mathrm{~g} / \mathrm{mL}$ stock solution. Cells were then washed five times with HBSS, and then refilled with $990 \mu \mathrm{~L}$ SFM. $10 \mu \mathrm{~L}$ of stock solution was then added to the $990 \mu \mathrm{~L}$ SFM. Cells were then incubated for 20 to 30 minutes. Subsequently, cells were washed three times with HBSS and refilled with 1 mL SFM to take control images. Then, cells were washed and the compounds of interest were loaded. After 15 min incubation with the compound, cells were washed three times with HBSS and refilled with fresh SFM ( 1 mL ). Confocal images were recorded immediately afterwards.
ii) Staining with endoplasmic reticulum ER tracker. The commercially available ER tracker Red was used as received from Invitrogen, as a 1 mM aqueous solution. From this $10 \mu \mathrm{~L}$ was diluted with $90 \mu \mathrm{~L}$ DMSO to obtain $100 \mu \mathrm{M}$ stock solutions. Then, cells were washed five times with HBSS and plates were refilled with $990 \mu \mathrm{~L}$ SFM. Subsequently, $10 \mu \mathrm{~L}$ of the diluted stock solution (prepared as above) was added to make $1 \mu \mathrm{M}$ solutions on the cell plate. Cells were incubated for 15 to 30 minutes and subsequently cells were washed three times with HBSS. The plates were refilled with 1 mL SFM to take control images cells stained with colocalisation dyes. Finally, cells were washed and the compound of interest for co-localisation studies was loaded. After 15 min incubation with the compound, cells were washed three times with HBSS and refilled with fresh SFM ( 1 mL ). Confocal images were recorded immediately afterwards.
iii) Staining with Nile Red. A stock solution of $10 \mu \mathrm{~g} / \mathrm{mL}$ Nile Red dye from Invitrogen was prepared in DMSO. To $10 \mu \mathrm{~L}$ of stock solution, a $990 \mu \mathrm{~L}$ aliquoted was added, resulting in a final concentration of $100 \mathrm{ng} / \mathrm{mL}$. After cells were incubated with this solution for 10 min a further 3 rounds of washings with HBSS were carried out, before the addition of 1 mL of serum free medium (SFM). Subsequently, a small volume of SFM was removed (e.g. $10 \mu \mathrm{~L}$ ) and the desired compound dissolved in DMSO was added in a volume equal to that which was removed previously, to obtain a final volume of 1 mL and the desired concentration. After 20 min incubation with the compound, cells were washed 3 times with PBS and subsequently fresh serum free medium was added ( 1 mL ). Images were recorded immediately afterwards.

## Fluorescence lifetime Measurements:

Time-correlated single-photon counting (TCSPC): Lifetime measurements were recorded using a Becker and Hick1 SPC830 TCSPC PCI module with an excitation wavelength of 910 nm and the emission measured at $360-580 \mathrm{~nm}$ (BG39, Comar Optics, UK). The measurement of compounds was carried out in DMSO/ water solvent with concentration of 10 mM or less. Emission spectral detection was carried out using an acton Research Component 275 spectrograph and an Andor iDus 740-BU CCD camera.

Two-photon Fluorescence lifetime imaging microscopy (FLIM): Cell uptake studies were performed using HeLa and PC3 cells. Cells were plated on a glass petri dishes and left cells to attach for 12-24 hours depending on the growth rate. Control FLIM were recorded before the addition of compound. Plates were then mounted on the microscope stage and kept at $37^{\circ} \mathrm{C}$. Compounds were dissolved in DMSO and added to cells to achieve final concentration of $100 \mu \mathrm{M}$ in EMEM/RPMI medium containing 1-2\% of DMSO. Cells were incubated for 15 minutes prior to confocal imaging, 2P FLIM was carried out immediately after the confocal imaging with the same area as the confocal imaging. The fluorescence decay curves were fitted to a multiexponential function as:

$$
\mathrm{I}(\mathrm{t})=\sum_{\mathrm{i}} \mathrm{a}_{\mathrm{i}} \exp \left(\frac{-\mathrm{t}}{\tau_{i}}\right)
$$

Where $I(t)$ is the fluorescence decay, $\tau_{i}$ is the lifetime of component $i$ and $a_{i}$ its intensity contribution to the fluorescence decay. For 2P FLIM, the full width at half maximum (FWHM), calculated from the lifetime distribution curve within the focal area was used to assess the error. The percentage of components $\tau 1$ (major) and $\tau 2$ (minor) in cells was obtained from the respective amplitudes a1 and a2 calculated using SPCImage software, which models the data for each individual pixel to Equation below, where F is fluorescence, a0 is background and $t$ is

$$
F(t)=a_{0}+a_{1} e^{-t / \tau_{1}}+a_{2} e^{-t / \tau_{2}}
$$

time:

## Saccharide titrations

The boronic acid moiety on compound III was protected by a pinacol group, giving III-BPin. The dynamic equilibrium process between boronic acid and diol can lead to the formation of more stable boronate ester if two different types of diols existed, as the binding constant between pinacol and boronic acid is far less than that with saccharide. All the tested monosaccharides induced a steady decrease of fluorescent intensity of compound III. The estimated binding constants indicated rather weak binding interactions, following the wellestablished selectivity orders for the binding of boronic acid derivatives to D -fructose $>\mathrm{D}$ galactose $>$ D-mannose $>$ D-glucose.

## Fluorescence titration of Compound III with $\boldsymbol{\beta}$-D-glucan

A stock solution of 'receptor' or 'host' ( 10 mM ) was made by dissolving fluorophore in DMSO. $\beta$-D-glucan (from barley, Aldrich) was completely dissolved in pH 8.21 aqueous buffer by heating ( $50{ }^{\circ} \mathrm{C}$ ), which generated this $1 \mathrm{mg} / \mathrm{mL}$ solution (considered the 'guest'). Increasing volumes of the guest were transferred to a 1 mL receptor solution in a fluorescent spectroscopy cuvette and were left for 5 minutes to allow complete guest and receptor binding. Next, the same volume of the mixture was removed maintaining the total volume unchanged after each titration. Fluorescence emission spectra were recorded after each titration. The observed stability constants (K) with a coefficient of determination ( $\mathrm{r}^{2}$ ) were calculated by the fitting emission intensity at a single wavelength versus polysaccharide concentration using custom written non-linear curve fitting (equation 1) within the Origin 9.0 software. The binding constant $(\mathrm{K})$ was determined by fitting a $1: 1$ binding model to $\mathrm{I}_{\mathrm{F}} / \mathrm{I}_{\text {Fmax }}$.

$$
y=\left(1+A_{1} * A_{2} * x\right) /\left(1+A_{1} * x\right)
$$

$y: I_{F} / I_{\text {Fmax }}$
$\mathrm{A}_{1}: \mathrm{K}$ (binding constant of the receptor with the guest)
$\mathrm{A}_{2}: \mathrm{I}_{\mathrm{Fmin}} / \mathrm{I}_{\mathrm{Fmax}} \mathrm{x}$ : the concentration of $\beta$-D-glucan added to a fluorophore
$\mathrm{I}_{\mathrm{Fmin}}$ is the final (minimum) fluorescence intensity;
$\mathrm{I}_{\mathrm{Fmax}}$ is the initial (maximum) fluorescence intensity;
$\mathrm{I}_{\mathrm{F}}$ is the fluorescence intensity after addition of $\beta$-D-glucan (considered as 'guest').

## X-ray Crystallography

Intensity data for Compound 3-BPin were collected at 150(2) K on a Rigaku SuperNova Dual EosS2 single crystal diffractometer using monochromated $\mathrm{Cu}-\mathrm{K} \alpha$ radiation $(\lambda=1.54184 \AA$ ). Unit cell determination, data collection data reduction and absorption correction were performed using the CrysAlisPro software [1]. The structures were solved with SHELXT [2] and refined by a full-matrix least-squares procedure based on F2 (SHELXL-2018/3) [2]. All non-hydrogen atoms were refined anisotropically. Hydrogen atoms were placed onto calculated positions and refined using a riding model. Where possible hetero atom hydrogen atoms have been located in the difference Fourier map and were refined freely or with bond length restraints. Additional programmes used for analysing data and their graphical manipulation included: SHELXle [3], ORTEP3 for windows [4] and Mercury. [5]

## Computational details

We used density functional theory (DFT) calculations as implemented in the Gaussian 09 package [6] to examine the structures, estimate the Mulliken charges on each of the atoms in the relaxed structures and construct molecular orbitals to predict the band gap that associated with the degree of charge transfer. The exchange correlation energy was modelled using the schemed parameterised by Perdew, Burke and Ernzerhof Perdew (PBE) [7]. We used PBEPBE exchange correlation functional and $6-31 \mathrm{G}^{* *}$ basis sets for all atoms $(\mathrm{B}, \mathrm{C}, \mathrm{N}, \mathrm{O}$ and H$)$ as implemented in the code. Mulliken analysis [8] was used to estimate the charges on the atoms in the relaxed optimised structures. GaussView 6.1.1 [9] was used to construct the corresponding frontier molecular orbital diagrams.

## 2. Synthetic protocols

### 2.1. Synthesis of Compound 1 .

## Step 1. Synthesis of 6-bromo-2-butyl-1H-benzo[de]isoquinoline-1,3(2H)-dione (Intermediate 1a)

4-Bromo-1,8-naphthalic anhydride ( $0.30 \mathrm{~g}, 1.08 \mathrm{mmol}$ ) was suspended in ethanol and warmed slightly to get a clear solution. One equivalent of butylamine ( 1.08 mmol ) was then added slowly to the solution. After refluxing for 6 hours the pale-yellow suspension was collected by vacuum filtration, and the resulting yellow solid was washed with ethanol and used without further characterisation in Step (b).

Scheme S1. The synthesis of Intermediate 1a

## Step 2. Synthesis of 2-butyl-6-((2-(methylamino)ethyl)amino)-1H-benzo[de]isoquinoline-1,3(2H)-dione (Intermediate 1b)

Intermediate 1a ( $0.39 \mathrm{~g}, 1.17 \mathrm{mmol}$ ), N -Methylethylenediamine ( $0.09 \mathrm{~g}, 1.17 \mathrm{mmol}$ ) and triethylamine ( $0.12 \mathrm{~g}, 1.17 \mathrm{mmol}$ ) were suspended in 2-methoxyethanol ( 2 mL ) and refluxed for 3 hours. The solvent was then removed, and the residue purified on silica gel by flash chromatography using dichloromethane/methanol ( $0-40 \%$ ), to give a yellow powder ( 0.20 g , 52 \%)

Scheme S2. The synthesis of Intermediate 1b
${ }^{\mathbf{1}} \mathbf{H}$ NMR ( 400 MHz, DMSO-d $_{6}, 25^{\circ} \mathrm{C}$ ): $\delta 8.71(\mathrm{dd}, \mathrm{J}=8.5,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 8.45(\mathrm{dd}, \mathrm{J}=7.3,1.0$ $\mathrm{Hz}, 1 \mathrm{H}), 8.29(\mathrm{~d}, \mathrm{~J}=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.79(\mathrm{t}, \mathrm{J}=5.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.72(\mathrm{dd}, \mathrm{J}=8.4,7.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.89$ (d, J = $8.6 \mathrm{~Hz}, 1 \mathrm{H}$ ), $4.05-3.97(\mathrm{~m}, 2 \mathrm{H}), 3.71(\mathrm{q}, \mathrm{J}=6.0 \mathrm{~Hz}, 2 \mathrm{H}), 3.26(\mathrm{t}, \mathrm{J}=6.1 \mathrm{~Hz}, 2 \mathrm{H}), 1.64$ $-1.52(\mathrm{~m}, 2 \mathrm{H}), 1.40-1.26(\mathrm{~m}, 2 \mathrm{H}), 0.91(\mathrm{t}, \mathrm{J}=7.4 \mathrm{~Hz}, 3 \mathrm{H})$.
${ }^{13}$ C NMR ( 101 MHz, DMSO- $_{6}, 25^{\circ} \mathrm{C}$ ): $\delta 163.7,162.9,150.0,134.0,130.8,129.2,129.0$, 124.5, 121.9, 120.4, 108.8, 104.1, 46.40, 32.65, 29.80, 19.82, 13.75.

ESI-MS: $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{19} \mathrm{H}_{23} \mathrm{~N}_{3} \mathrm{O}_{2}$ calc. 326.1886, found 326.1875
Step 3. Synthesis of (2-(((2-((2-butyl-1,3-dioxo-2,3-dihydro-1H-benzo[de]isoquinolin-6yl)amino)ethyl)(methyl)amino)methyl)phenyl)boronic acid (Compound 1)

Intermediate $\mathbf{1 b}(0.1 \mathrm{~g}, 0.30 \mathrm{mmol})$, 2-bromophenylboronic acid ( $0.09 \mathrm{~g}, 0.30 \mathrm{mmol}$ ), and triethylamine ( $0.03 \mathrm{~g}, 0.30 \mathrm{mmol}$ ) were dissolved in acetonitrile $(10 \mathrm{~mL})$ and stirred for 1 hour at room temperature, after which time a precipitate crashed out. The precipitate was the collected by vacuum filtration and washed with acetonitrile ( 15 mL ). This afforded the desired product as a yellow powder $(0.09 \mathrm{~g}, 65 \%)$. The analogous protocol was performed using 2bromophenylboronic acid pinacol ester ( 0.30 mmol ), or by treating compound $\mathbf{1}$ with excess pinacol, followed by semi prep HPLC purification. Compound 1.BPin was isolated in analytical scale ( $<5 \mathrm{mg}$ ) and characterised by mass spectrometry

### 2.2 Synthesis of Compound 2.

## Step 1. Synthesis of 6-bromo-2-propyl-1H-benzo[de]isoquinoline-1,3(2H)-dione (Intermediate 2a)

4-Bromo-1,8-naphthalic anhydride ( $1.0 \mathrm{~g}, 3.6 \mathrm{mmol}$ ) and $n$-propylamine ( $0.3 \mathrm{~mL}, 3.6 \mathrm{mmol}$ ) were dissolved in ethanol ( 50 mL ), heated to at reflux for 6 six hours under a flow of nitrogen. After concentrating the reaction mixture under reduced pressure, the resulting suspension was transferred into ice water $(100 \mathrm{~mL})$. The crude product was filtered and purified by column chromatography. The desired compound, intermediate 2a, was obtained as a grey solid (1.03 g, yield: $89 \%$ ).

Scheme S4. The synthesis of Intermediate 2a
${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $8.50(\mathrm{~d}, J=7.29 \mathrm{~Hz}, 1 \mathrm{H}), 8.39(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 1 \mathrm{H}), 8.25(\mathrm{~d}, J=$ $7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.89(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.71(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.03(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 1.73-$ $1.61(\mathrm{~m}, 2 \mathrm{H})$ and $0.93(\mathrm{t}, J=7.5 \mathrm{~Hz}, 3 \mathrm{H})$.
${ }^{13}$ C NMR (75.5 MHz, $\mathrm{CDCl}_{3}$ ): $163.5,163.5,133.1,131.9,131.1,131.0,130.5,130.1,128.8$, 128.0, 123.0, 122.2, 42.1, 21.4, 11.6

ESI-MS $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{15} \mathrm{H}_{13} \mathrm{BrNO}_{2}$ calc. 318.0124 , found 319.1413

## Step 2. Synthesis of 6-hydrazineyl-2-propyl-1H-benzo[de]isoquinoline-1,3(2H)-dione (Intermediate 2b)

Intermediate $\mathbf{2 a}(1.03 \mathrm{~g}, 3.24 \mathrm{mmol})$ and hydrazine hydrate $(0.3 \mathrm{ml}, 0.31 \mathrm{~g}, 9.5 \mathrm{mmol})$ were dissolved in 2-methyoxylethanol ( 4 mL ) and heated to reflux for 3 hours. After cooling to room temperature, precipitation was collected and washed with ethanol. Silica chromatography ( $95 \%$ MeOH in DCM ) was employed to purify and a yellow solid $\mathbf{2 b}$ was obtained ( $0.62 \mathrm{~g}, 71.3 \%$ ).

Scheme S5. The synthesis of Intermediate 2b
${ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO-d ${ }_{6}$ ): 9.09 (s, 1H), 8.59 (d, $J=7.8 \mathrm{~Hz}, 1 \mathrm{H}$ ), 8.40 (d, $J=7.8 \mathrm{~Hz}$, $1 \mathrm{H}), 8.28(\mathrm{~d}, J=9 \mathrm{~Hz}, 1 \mathrm{H}), 7.60(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.23(\mathrm{~d}, J=9 \mathrm{~Hz}, 1 \mathrm{H}), 3.96(\mathrm{t}, J=6 \mathrm{~Hz}$, $2 \mathrm{H}), 1.68-1.55(\mathrm{~m}, 2 \mathrm{H}), 0.90(\mathrm{t}, J=6 \mathrm{~Hz}, 3 \mathrm{H})$

### 2.2 Synthesis of Compound 3

## Alternative method for the synthesis of 6-bromo-2-propyl-1H-benzo[de]isoquinoline-1,3(2H)-dione (3a):

4-bromo-1,8-naphthalic anhydride ( $1.0 \mathrm{~g}, 3.6 \mathrm{mmol}$ ) and $n$-propylamine ( $0.3 \mathrm{~mL}, 3.6 \mathrm{mmol}$ ) were dissolved in ethanol $(30 \mathrm{~mL})$ and heated to reflux for 6 hours. The suspension was then cooled to room temperature and precipitate collected and washed with ethanol to obtain a grey solid ( $1.03 \mathrm{~g}, 89 \%$ ).

Scheme S7. The synthesis of Intermediate 3a
${ }^{1}$ H NMR ( 400 MHz, DMSO-d $_{6}, 25{ }^{\circ} \mathrm{C}$ ): $\delta 8.51(\mathrm{dd}, J=7.2,13.7 \mathrm{~Hz}, 2 \mathrm{H}), 8.29(\mathrm{~d}, J=7.8 \mathrm{~Hz}$, $1 \mathrm{H}), 8.18(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.96(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.98(\mathrm{t}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 1.65(\mathrm{~h}, J=7.4$ $\mathrm{Hz}, 2 \mathrm{H}), 0.92(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H})$.
${ }^{13}$ C NMR ( 101 MHz, DMSO- $_{6}, 25^{\circ} \mathrm{C}$ ): $\delta 162.9,162.8,132.5,131.5,131.2,130.9,129.8$, 129.1, 128.8, 128.3, 122.7, 122.0, 41.3, 20.8, 11.3.

ESI-MS: $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{15} \mathrm{H}_{13} \mathrm{BrNO}_{2}$ calc. 319.1728 , found 319.1657

## Synthesis of 6-hydrazineyl-2-propyl-1H-benzo[de]isoquinoline-1,3(2H)-dione (3b):

Intermediate $3 \mathbf{a}(1.03 \mathrm{~g}, 3.24 \mathrm{mmol})$ and hydrazine hydrate $(0.306 \mathrm{~g}, 9.5 \mathrm{mmol})$ were dissolved in 2-methoxyethanol ( 4 mL ) and refluxed for 3 hours. The mixture was then cooled to room temperature and the precipitate collected and washed with cold ethanol. Product was obtained as an orange solid ( $0.62 \mathrm{~g}, 71.3 \%$ ).

Scheme S8. The synthesis of Intermediate 3b
${ }^{1}$ H NMR ( 400 MHz , DMSO-d ${ }_{6}, 25^{\circ} \mathrm{C}$ ): $\delta 9.09(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 8.58(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.40(\mathrm{~d}$, $J=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 8.27$ (d, $J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.61$ (t, $J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.23$ (d, $J=8.6 \mathrm{~Hz}, 2 \mathrm{H})$, $4.66\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{NH}_{2}\right), 3.96(\mathrm{t}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 1.62(\mathrm{~h}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 0.90(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H})$. ${ }^{13}$ C NMR ( 101 MHz, DMSO- $_{6}, 25^{\circ} \mathrm{C}$ ): $\delta 163.7,163.0,153.1,134.2,130.6,129.3,128.2$, 124.1, 121.7, 118.4, 107.3, 104.0, 40.7, 21.0, 11.4.

ESI-MS: $[\mathrm{M}+\mathrm{Na}]^{+} \mathrm{C}_{15} \mathrm{H}_{15} \mathrm{~N}_{3} \mathrm{O}_{2}$ calc. 292.1062, found 292.1013

## Synthesis of (E)-2-propyl-6-(2-(4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)benzylidene)hydrazineyl)-1H-benzo[de]isoquinoline-1,3(2H)-dione (Compound 3BPin)

Intermediate $\mathbf{3 b}$ ( $0.15 \mathrm{~g}, 0.56 \mathrm{mmol}$ ) and 4-formylbenzoic boronic acid pinacol ester ( 0.14 g , 0.6 mmol ), were dissolved in ethanol and heated to reflux for 6 hours. The reaction was cooled
over ice and the resultant precipitate collected and washed with cold ethanol. The product was obtained as an orange solid ( $0.114 \mathrm{~g}, 40 \%$ ).

Scheme S9. The synthesis of Compound 3-BPin
${ }^{1} \mathbf{H}$ NMR (400 MHz, DMSO- $\left.\mathrm{d}_{6}, 25{ }^{\circ} \mathrm{C}\right): \delta 11.5(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 8.77(\mathrm{~d}, J=8.5 \mathrm{~Hz}), 8.46(\mathrm{~d}, J$ $=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.42(\mathrm{~s}, 1 \mathrm{H}), 8.37(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.80-7.71(\mathrm{~m}, 6 \mathrm{H}), 3.97(\mathrm{t}, J=7.4 \mathrm{~Hz}$, $2 \mathrm{H}), 1.63(\mathrm{~h}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 1.32(\mathrm{~s}, 12 \mathrm{H}), 0.91(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H})$.

HPLC: 9.51 min

### 2.3 Synthesis of Compound III-BPin:

The synthesis of Compound III-BPin was carried out according to the literature method. [10]

2-propyl-6-(2-(2-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)benzylidene)hydrazinyl)-1H-benzo[de]isoquinoline-1,3(2H)-dione (Compound III)

Scheme S10. The synthesis of Compound III-BPin

Briefly, intermediate $\mathbf{2 b},(0.287 \mathrm{~g}, 1.06 \mathrm{mmol})$ was dissolved in $\mathrm{MeOH} / \mathrm{DMF}$ and to this 2-aldehyde-pinacol-boronate ester, ( $0.252 \mathrm{~g}, 1.08 \mathrm{mmol}$ ) was added, followed by stirring at room temperature for 12 hours. Solid was precipitated out after pouring the mixture into an ice-water mixture. The crude product was first recrystallized then advanced purification by flash column chromatography followed, leading to the isolation of compound III as its pinacol-protected boronate ( $0.04 \mathrm{~g}, 8 \%$ yield). [Ref 10]
${ }^{1} \mathbf{H}$ NMR (300 MHz, DMSO-d ${ }_{6}$ ) 11.67 (s, NH, 1H), 8.98 (s, 1H), 8.49 (d, J=7.2 Hz, 1H), 8.37 (d, $J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.15(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.78(\mathrm{~m}, 3 \mathrm{H}), 7.57(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.41(\mathrm{t}, J$ $=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.98(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 2 \mathrm{H}), 1.63(\mathrm{~m}, 2 \mathrm{H}), 1.36(\mathrm{~s}, 12 \mathrm{H}), 0.93(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H})$

Figure S33. Evaluation of the kinetic stability of compound III-BPin in mixtures of solvents: Black (pure methanol), Red ( $3.8 \%$ water in MeOH ), Blue ( $17 \%$ water in MeOH ), green ( $33 \%$ water in MeOH ) Conc. [III] $=1 \times 10^{-5} \mathrm{M}$; $\lambda \mathrm{ex}=470 \mathrm{~nm}$.

Figure S34: Fluorescence emission monitoring of the pH profiles characteristic of compound III-BPin behaviour in wet solvents, recorded with and without presence of D-fructose; [III] $=1 \times 10^{-5} \mathrm{M} ; \lambda \mathrm{ex}=470 \mathrm{~nm}$; Experiments were carried out in pH 7.4 PBS buffer solutions with $83 \%$ vol content of methanol. To ensure full equilibration of the system, the solution was also left to stand for 30 minutes before being used for further experiments. Black line: compound III-BPin alone; Red Line: Compound III:D-fructose 1:1 mixture.

Figure S35: (a) Fluorescent spectral changes of compound III-BPin along with addition of Dfructose; (b) Ratio of F/F0 at 545 nm of compound III-BPin vs. concentration of D-fructose; $[$ IIII $]=1 \times 10^{-5} \mathrm{M} ; \lambda \mathrm{ex}=470 \mathrm{~nm} ; \lambda \mathrm{em}=545 \mathrm{~nm}$; experimented conducted in wet MeOH ( 3.8 \% Milli-Q water).

Table S2. The observed binding stabilities and R2 of compound III-BPin with different saccharides

|  | $K_{\text {obs }}$ | $\mathrm{R}^{2}$ |
| :---: | :---: | :---: |
| D-fructose | $170.6 \pm 7.52$ | 0.997 |
| D-galacotose | $39.15 \pm 2.33$ | 0.998 |
| D-mannose | $19.04 \pm 1.82$ | 0.994 |
| D-glucose | $9.76 \pm 2.79$ | 0.981 |

Figure S36. Representative fructose binding tests for compounds 3-BPin and III-BPin in aqueous DMSO, monitored by UV-Vis and fluorescence spectroscopies (excitation at 405 nm ). Stock solutions were made in DMSO and with D-fructose stock containing Milli-Q water ( $0.5 \%$ total end volume: this has prevented any crashing out of fructose from pure DMSO).

Figure S37. A visual comparison between the compound 3-BPin and III-BPin with respect to their colorimetric response to addition of fructose. Stock solutions were made in DMSO and with D-fructose stock containing Milli-Q water to aid dissolving ( $0.5 \%$ total end volume: this has prevented any crashing out of fructose from pure DMSO).

Figure S38. Spectroscopic investigations into the behaviour of compound $\mathbf{1}$ under variable pH conditions. Compound $\mathbf{1}$ final concentrations were 2.5 uM for fluorescence spectroscopy, 7.5 uM in DMSO for UV-Vis spectroscopy ( $1 \%$ DMSO in buffers). Conditions: Buffers from pH 1.1 to pH 10 were made using a Fisher brand Hydrus 600 pH meter in order to investigate the stability of compounds by fluorescence spectroscopy. The following buffer systems were used: $\mathrm{pH}=1.1 \mathrm{KCl} / \mathrm{HCl} ; \mathrm{pH}=2.0 \mathrm{KCl} / \mathrm{HCl} ; \mathrm{pH}=3.0$ Glycine $/ \mathrm{HCl} ; \mathrm{pH}=5.0$ Acetic Acid / Sodium acetate; $\mathrm{pH}=7.0$ Sodium phosphate Monobasic / Sodium phosphate Dibasic; $\mathrm{pH}=9.0$ Glycine/Sodium Hydroxide; $\mathrm{pH}=10.0$ Sodium Carbonate Anhydrous/Sodium Hydrogen Carbonate.

Figure S39. Spectroscopic investigations into the behaviour of compound 3-BPin under variable pH conditions. Compound 1 concentration was 20 uM in DMSO, for fluorescence spectroscopy, 7.5 uM in DMSO for UV-Vis spectroscopy. Conditions: Buffers from pH 1.1 to pH 10 were made using a Fisher brand Hydrus 600 pH meter in order to investigate the stability of compounds by fluorescence spectroscopy. The following buffer systems were used: $\mathrm{pH}=1.1 \mathrm{KCl} / \mathrm{HCl} ; \mathrm{pH}=2.0 \mathrm{KCl} / \mathrm{HCl} ; \mathrm{pH}=3.0$ Glycine $/ \mathrm{HCl} ; \mathrm{pH}=5.0$ Acetic Acid / Sodium acetate; $\mathrm{pH}=7.0$ Sodium phosphate Monobasic / Sodium phosphate Dibasic; $\mathrm{pH}=9.0$ Glycine/Sodium Hydroxide; $\mathrm{pH}=$ 10.0 Sodium Carbonate Anhydrous/Sodium Hydrogen Carbonate.

Figure S40. Spectroscopic investigations into the behaviour of compound $\mathbf{1}$ over 24 h in DMSO solutions. Compound 1 concentration was 7.5 uM in DMSO for UV-Vis spectroscopy, 2.5 uM in DMSO, for fluorescence spectroscopy,

Figure S41. Spectroscopic investigations into the behaviour of compound $\mathbf{1}$ over 24 h in DMSO solutions. Compound 1 concentration was 7.5 uM in DMSO:RMPI cellular medium ( $1: 1 \mathrm{v} / \mathrm{v}$ ) for UV-Vis spectroscopy, 2.5 uM in DMSO:RMPI cellular medium ( $1: 1 \mathrm{v} / \mathrm{v}$ ), for fluorescence spectroscopy.

Figure S42. Spectroscopic investigations into the behaviour of compound 2-BPin over 24 h in DMSO solutions. Compound 2-BPin concentration was 7.5 uM in DMSO for UV-Vis spectroscopy, 2.5 uM in DMSO, for fluorescence spectroscopy.

Figure S43. Spectroscopic investigations into the behaviour of compound 2-BPin over 24 h in DMSO solutions. Compound 2-BPin concentration was 7.5 uM in DMSO:RMPI cellular medium ( $1: 1 \mathrm{v} / \mathrm{v}$ ) for UV-Vis spectroscopy, 2.5 uM in DMSO:RMPI cellular medium ( $1: 1$ $\mathrm{v} / \mathrm{v}$ ), for fluorescence spectroscopy.

Figure S44. Spectroscopic investigations into the behaviour of compound 3-BPin over 24 h in DMSO solutions. Compound 2-BPin concentration was 7.5 uM in DMSO for UV-Vis spectroscopy, 2.5 uM in DMSO , for fluorescence spectroscopy.

Figure S45. Spectroscopic investigations into the behaviour of compound 3-BPin over 24 h in DMSO solutions. Compound 2-BPin concentration was 7.5 uM in DMSO:RMPI cellular medium ( $1: 1 \mathrm{v} / \mathrm{v}$ ) for UV-Vis spectroscopy, 2.5 uM in DMSO:RMPI cellular medium ( $1: 1$ $\mathrm{v} / \mathrm{v}$ ), for fluorescence spectroscopy.

## 4. Cellular Imaging Assays

Figure S46. Control experiments: Confocal images of living HeLa cells incubated with $1 \%$ DMSO for 15 min at $37^{\circ} \mathrm{C}$

Figure S47. Laser confocal fluorescence imaging of Compound 1-BPin at $37^{\circ} \mathrm{C}$ (living HeLa cells micrographs show cellular membrane aggregation at $100 \mu \mathrm{M}$ concentration in the absence of PBS).

$$
\lambda_{\text {em }}=450 \mathrm{~nm} \quad \lambda_{\text {em }}=515 \mathrm{~nm} \quad \lambda_{\mathrm{em}}=630 \mathrm{~nm} \quad \text { DIC }
$$

Figure S48. Laser confocal fluorescence imaging of Compound 1-BPin at $37^{\circ} \mathrm{C}$ co-incubated with Hoechst nuclear stain in living HeLa cells (micrographs recorded after PBS washing. Hoescht nucleic acid stain, $1 \mu \mathrm{~g} / \mathrm{mL}, 30 \mathrm{~min}, \lambda \mathrm{ex}=405 \mathrm{~nm}, 1-\mathrm{BPin} 100 \mu \mathrm{M}, 15 \mathrm{~min}$ incubation.

Figure S49. Laser confocal fluorescence imaging of Compound 1-BPin at $4^{\circ} \mathrm{C}, 15 \mathrm{~min}$ incubation, $100 \mu \mathrm{M}, 1 \%$ DMSO in living HeLa cells (micrographs recorded after PBS washing).

Figure S50. Laser confocal fluorescence imaging of Compound 1@Beta-D-Glucan, $37{ }^{\circ} \mathrm{C}$, 15 min incubation, $0.5 \%$ DMSO in living HeLa cells.

Figure S51. Laser confocal fluorescence imaging of Compound 2-BPin at $4^{\circ} \mathrm{C}, 15 \mathrm{~min}$ incubation, $100 \mathrm{uM}, 1 \%$ DMSO in living HeLa cells.

Figure S52. Confocal images recorded for living HeLa cells incubated with Compound 2-
BPin at $100 \mu \mathrm{M}$ for 15 min under various laser excitation conditions ( $1 \% \mathrm{DMSO}$, at $37^{\circ} \mathrm{C}$ );

Figure S53. Confocal images recorded for living HeLa cells incubated with compound 2BPin at $100 \mu \mathrm{M}$ for $15 \mathrm{~min}=\left(1 \% \mathrm{DMSO}\right.$, at $\left.37^{\circ} \mathrm{C}\right)$; co-localised with ER Tracker dye.

Figure S54. Laser confocal fluorescence imaging of Compound 2@Beta-D-Glucan at 37
${ }^{\circ} \mathrm{C}$, 15 min incubation, $0.5 \%$ DMSO in living HeLa cells.

Figure S55. Laser confocal fluorescence imaging of Compound 2-BPin at $4^{\circ} \mathrm{C}, 15 \mathrm{~min}$ incubation, 1 \% DMSO in living HeLa cells.

Figure S56. Laser confocal fluorescence imaging of Compound 2@Beta-D-Glucan at $37^{\circ} \mathrm{C}$,
15 min incubation, $2 \%$ DMSO in living HeLa cells.

Figure S57. Confocal Fluorescence imaging with compound 3-BPin in living PC-3 cells, 15 min incubation under various conditions ( $\lambda$ ex. 405 nm )

Overlay

$\lambda_{\mathrm{em}}=630 \mathrm{~nm}$
DIC

Figure S58. Confocal Fluorescence imaging with compound $\mathbf{1}$ in living PC-3 cells, 15 min incubation at $2 \mu \mathrm{M}, 20 \mathrm{~min}$ incubation at $37^{\circ} \mathrm{C}$ ( $\lambda$ ex. 488 nm ).

Figure S59. Confocal Fluorescence imaging with (un-protected) compound $\mathbf{1}$ in living PC-3 cells, 20 min incubation at $250 \mathrm{nM}, 20 \mathrm{~min}$ incubation at $37^{\circ} \mathrm{C}(\lambda \mathrm{ex} 405 \mathrm{~nm}$.$) .$

Figure S60. Laser confocal fluorescence imaging of (un-protected) Compound 1, $250 \mathrm{nM}, 20$ min incubation at $37^{\circ} \mathrm{C}$. Co-localisation experiment with Nile Red stain.

Figure S61. Laser confocal fluorescence imaging of Compound 3, $1 \mu \mathrm{M}, 20 \mathrm{~min}$ incubation at $37^{\circ} \mathrm{C}$. Co-localisation experiment with Nile Red stain.

Figure S62. Confocal Fluorescence imaging with compound 3-BPin in living PC-3, 15 min incubation under various conditions ( $\lambda$ ex. 488 nm )

Figure S63. Confocal Fluorescence imaging with compound 3-BPin in living PC-3 cells, 15 min incubation under various conditions ( 15 min incubation, $\lambda$ ex. 405 nm )

Figure S64 Confocal Fluorescence imaging with compound 3-BPin in living PC3 15 min incubation under various conditions ( $\lambda$ ex $488 \mathrm{~nm}, 0.2 \%$ DMSO)

Figure S65. Epifluorescence imaging with compound III-BPin in living HeLa cells under 15 min incubation, $37^{\circ} \mathrm{C}, 2 \mu \mathrm{M}$ probe III-BPin $0.2 \%$ DMSO, in presence, and absence of excess beta-D-glucan. Micrographs show: $\mathrm{A}(1-2)$ overlay images of $\mathrm{B}(1-2)$ and $\mathrm{C}(1-2)$, respectively; (B1-2) fluorescence images with $\lambda_{\mathrm{ex}}=460-500 \mathrm{~nm}$, long-pass filtered at 510 nm , showing the biolocalisation of 1 throughout the cytoplasm; (C1-2) brightfield images

Figure S66. 2-photon FLIM control experiments aiming to evaluate effect of autofluorescence ( $1 \%$ DMSO, 15 min incubation at $37^{\circ} \mathrm{C}$ in living HeLa cells, 2 P excitation, $\lambda e x=910 \mathrm{~nm})$

Figure S67. Cellular fluorescence intensity and lifetime maps, selected lifetime decay plot with data fit. For 2photon FLIM images, cells were treated with $100 \mu \mathrm{M}$ of compounds DMSO, ex $=910 \mathrm{~nm}$ where: (a) compound 2-BPin, $37^{\circ} \mathrm{C}, 1 \%$ DMSO. (b) compound 2@glucan, $37^{\circ} \mathrm{C}, 0.5 \%$ DMSO, excess beta-D-Glucan c) compound 2-BPin, $4{ }^{\circ} \mathrm{C}$, in $1 \%$ DMSO. Micrographs are showing the two-photon fluorescence intensity diagram of compounds, the fluorescence lifetime map of $\mathrm{t}_{\mathrm{m}}$ of compounds in HeLa cells and corresponding fitted parameters.

Figure S68. Cellular fluorescence intensity and lifetime maps, selected lifetime decay plot with data fit. For 2photon FLIM images, cells were treated with $100 \mu \mathrm{M}$ of compounds. Cells were incubated at $37^{\circ} \mathrm{C}$ or $4^{\circ} \mathrm{C}$ where micrographs (a) and (b) represent different fields of view for $\mathbf{1 - B P i n},\left(37^{\circ} \mathrm{C}, \lambda e x=910 \mathrm{~nm}, 1 \%\right.$ DMSO and post-PBS washing); (c) $\mathbf{1} @$ glucan $\left(37^{\circ} \mathrm{C}, \lambda \mathrm{ex}=910 \mathrm{~nm}, 0.5 \%\right.$ DMSO and excess beta-D-glucan); (d) 1BPin, $4^{\circ} \mathrm{C}$, $\lambda \mathrm{ex}=910 \mathrm{~nm}, 1 \%$ DMSO, post-PBS washing.

## 5. MTT assays in PC-3 cells

Figure

Compound 1-BPin: $\mathrm{IC}_{50}=2.06536 \times 10^{-7} \pm 9.7116 \times 10^{-8} \mathrm{M}$
Compound 2-BPin: $\mathrm{IC}_{50}=1.83593 \times 10^{-5} \pm 3.6745 \times 10^{-6} \mathrm{M}$

Figure S69. MTT assays of PC3 cells treated with (a) 1-BPin and (b) 2-BPin showing their dose response curves at 48 h . Error bars stand for standard error calculated from the six independent repeats.

$24 \mathrm{~h}: \mathrm{IC}_{50}=4.75667 \times 10^{-5} \pm 0.80307 \times 10^{-6} \mathrm{M}$
$48 \mathrm{~h}: \mathrm{IC}_{50}=1.06607 \times 10^{-5} \pm 0.22857 \times 10^{-6} \mathrm{M}$
Figure S70. MTT assays of PC3 cells treated with 3-BPin at (a) 24 hours and (b) 48 hours showing the dose response curve. Error bars stand for standard error calculated from six independent repeats.

Figure S71. A comparison of $\mathrm{IC}_{50}$ values (M) from MTT assays in PC3 cells, treated with compounds 1-BPin, 2-BPin and 3-BPin (48 h assays). Error bars stand for standard error calculated from the six repeats.

Figure S72. MTT assays of PC3 cells treated with beta-D-glucan for 48 hours showing that this biopolymer is non-toxic in the interval tested. Error bars stand for standard error calculated from the six repeats.

$$
\mathrm{IC}_{50}=3.06415 \times 10^{-5} \pm 3.258816 \times 10^{-6} \mathrm{M}
$$

Figure S73. MTT assays of PC3 cells treated with cis-platin $\left[\mathrm{Pt}(\mathrm{Cl})_{2}\left(\mathrm{NH}_{3}\right)_{2}\right]$ for 48 hours showing the dose response curve. Error bars stand for standard error calculated from the six repeats.
6. Structural Investigations of Compound 3-BPin by Gas Phase DFT Calculations

Optimised geometry of 3-BPin

Figure S74. Relaxed, optimised geometry of naphthalimide boronate with pinacol-protected boronic acid group.

Table S3. Selected bond lengths and bond angles in the optimised structure of naphthalimide boronate with pinacol-protected boronic acid group.
