## 1. General information

Reactions were monitored by thin layer chromatography using UV light to visualize the course of reaction. Purification of reaction products was carried out by flash chromatography on silica gel or just by simple filtration and washing.  $^1\text{H}$  and  $^{13}\text{C}$ NMR spectra were obtained using a Bruker DPX-400 spectrometer.  $^1\text{H}$  NMR chemical shifts are reported in ppm ( $\delta$ ) relative to tetramethylsilane (TMS) with the solvent resonance employed as the internal standard. Data are reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, m = multiplet), coupling constants (Hz) and integration.  $^{13}\text{C}$  NMR chemical shifts are reported in ppm ( $\delta$ ) from tetramethylsilane (TMS) with the solvent resonance as the internal standard. Melting points were measured on an electrothermal digital melting point apparatus.

## 2. Catalyst-free synthesis of bispiro[Fischer's base-oxindole] skeletons 3

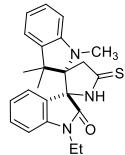

In a sealed tube equipped with a magnetic stirring bar, a mixture of 3-isothiocyanato oxindole **1** (0.2 mmol), Fischer's base **2** (0.3 mmol) in 1.0 mL of DCM was stirred at rt for 10 h, and then was directly loaded onto a silica gel and purified by flash chromatography to give the desired product **3**, using hexane/EtOAc (10/1, v/v) as the eluent. The lack of purity of the spectra is caused by the presence of a very small amount of diastereoisomers and impurities contained in the compounds (**3ae**, **3ai**, **3aj**, **3ak**, **3al**, **3bb**, **3bc**, **3be**, **3bf**, **3bh** and **3cb**). It is difficult to recrystallize them for purification.

#### 4. Preparative scale synthesis of the product 3aa

In a sealed tube equipped with a magnetic stirring bar, a mixture of 3-isothiocyanato oxindole **1a** (2.0 mmol), Fischer base **2a** (3.0 mmol) in 10.0 mL of DCM was stirred at rt for 10 h, and then was directly loaded onto a silica gel and purified by flash chromatography (hexane/EtOAc, 10/1, v/v) to give the desired product **3aa** (0.59 g, 78%, >20:1 dr).

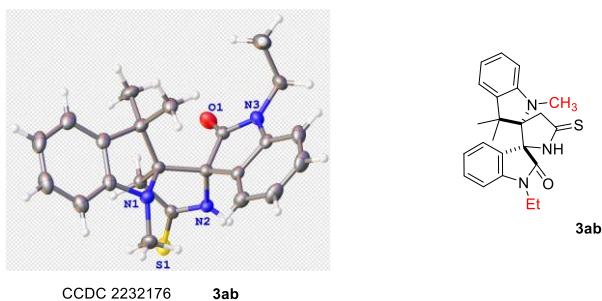

#### 5. Further investigation of transformation of 3ag

To a stirred solution of **3ag** (78.2 mg, 0.20 mmol) in acetone (1.0 mL) was added  $K_2CO_3$  (41 mg, 0.30 mmol) at 0 °C. Then iodomethane (43 mg, 0.30 mmol) in 2.0 mL acetone was added dropwise into the stirred reaction mixture. The reaction mixture was allowed to stir at room temperature for another 12 h, and was directly loaded onto a silica gel and purified by flash chromatography (hexane/EtOAc, 10/1, v/v) to give the desired product **4ag**.
