1. General Considerations

General Information: Unless otherwise noted, all chemicals were purchased and used without further purification. $^1$H NMR and $^{13}$C NMR spectra were recorded at ambient temperature on a 300 or 400 MHz NMR spectrometer (75 or 100 MHz for $^{13}$C). NMR experiments are reported in $\delta$ units, parts per million (ppm), and were referenced to CDCl$_3$ ($d$ 7.26 or 77.0) as the internal standard. The coupling constants $J$ are given in Hz. Column chromatography was performed using EM Silica gel 60 (300-400 mesh).

2. General Synthetic Procedures

All Enamides (1a-1q) were prepared according to the previous reports. Besides lauroyl peroxide (LPO) was purchased, other diacyl peroxides were prepared according to the previous reports.

The Light Source and the Material of the Irradiation Vessel:

The photochemical reaction was carried out under visible light irradiation by a 20W 440-450 nm blue LED at room temperature. This blue LED was purchased from taobao (link: https://m.tb.cn/h.UGjMWKP?sm=3da13d?tk=meq7dJPlct4). The blue LED’s energy peak wavelength is 448 nm, the peak width at half-height is 18.0 nm, and irradiance@20 W is 35.07 mW/cm². The reaction vessel is a borosilicate glass tube. The distance between the tube and lamp is about 1cm, and no filter is applied.

The mixture was stirred at room temperature under 440-450 nm blue LEDs for 16 hours. Then, the solvent was evaporated under reduced pressure, and the residue was purified by silica gel flash column chromatography to obtain the product 3aa in 69% yield (1.118 g).

(2) **Conversion of the Configuration of 3aa**

A mixture of 3aa (40.6 mg, 0.1 mmol), trifluoroacetic acid (57 mg, 0.5 mmol) in dry benzene (2.0 mL) were stirred at 110 °C for 36 h. Upon completion, the solution was concentrated in vacuum and the product was isolated through flash column chromatography to furnish Z-3aa as colourless oil (26.4 mg, 65% yield).

(3) **Hydrolysis of 3aa**

3aa (40.6 mg, 0.1 mmol) was dissolved in THF (2.0 mL) and concentrated hydrochloric acid (0.4 mL) were added sequentially. The mixture was stirred at 50 °C for 24 h. Upon completion, the solution was concentrated in vacuum and the product was isolated through flash column chromatography to give 4 as colourless oil (25.4 mg, 93% yield).

(4) **Cleavage of N-Boc Protecting Group**
The mixture of 3ua (41.5 mg, 0.1 mmol) and ZnBr₂ (44.4 mg, 0.2 mmol) in DCM (1.0 mL) was stirred at room temperature for 6 hours. The solvent was then removed under vacuum. The residue was purified by flash column chromatography, giving the desired product 5 (16.1 mg, 51% yield).

(5) The palladium-catalyzed Heck-coupling reaction

A mixture of 3oa (48.5 mg, 0.1 mmol), Pd(OAc)₂ (2.3 mg, 10 mol%), tricyclohexylphosphane (5.6 mg, 20 mol%), and Cs₂CO₃ (39.1 mg, 0.12 mmol) in DMF (2.0 mL) were stirred at 120 °C for 24 h. Upon completion, the solution was concentrated in vacuum and the product was isolated through flash column chromatography to give 5 as colourless oil (16.8 mg, 42% yield).

3.3 Fluorescence Quenching Experiments

Fluorescence quenching experiments were measured on an Ahilent Technologies Cary Eclipse Fluoresence Spectrophotometer. The Ru(bpy)$_3$Cl$_2$·H$_2$O photocatalyst was excited at 450 nm and the emission spectrum max = 600 nm was recorded. The concentration of photocatalyst stock solution was 1 x 10$^{-5}$ M in DCE. LPO with different concentrations were added into the solution of photocatalyst in DCE (3 mL) at room temperature. After being stirred with a thin glass rod, the emission spectrum was collected. Linear regression of $I_0/I$ against concentration is done in Origin 2018 (Figure S7).

**Figure S7.** Stern-Volmer fluorescence quenching of the excited Ru(bpy)$_3$Cl$_2$·H$_2$O with LPO.
3.4 Cyclic voltammetry study

Cyclic voltammetric investigations were performed on the DonghuaDH7000C electrochemical workstation with the conventional three-electrode system. The electrodes are first polished with sandpaper, then with alumina powder until the surface of the electrodes is mirror-like. Finally, the electrodes are washed with distilled water and ultrasonication. The solvent exhaust employs a nitrogen blast for 1 h. A glassy carbon electrode was used as the working electrode, a saturated calomel electrode (SCE) and platinum electrode were used as the reference electrode and counter electrode, respectively. LPO (1 mM) was tested with tetrabutylammonium hexafluorophosphate (0.1 M) as the supporting electrolyte in 40 mL MeCN. Solutions were kept under positive pressure of nitrogen during the measurements. Cyclic voltammetry (CV) with the following settings: Scan Rates = 0.1 V/s, Sweep Segments = 10, Sample Interval = 0.001 V, Quiet Time = 2 sec.
