### Experimental section

Variable-temperature powder X-ray diffraction (PXRD) measurements and Fourier transform-infrared spectroscopy (FT-IR, ALPHA) were performed to measure the purity of the compound. DSC measurement was performed on a NETZSCH DSC 214 instrument with a rate of  $20 \text{ K min}^{-1}$ . For complex dielectric measurements, the polycrystalline samples were ground into powder and then pressed into a thin plate. After that, the plate is cut into a rectangular shape with dimensions slightly and coated with silver glue on both sides of the rectangle to connect with the electrode for dielectric measurements. The dielectric constant measurement was carried out on TH2828 analyzer over the frequency range 500 Hz - 1 MHz to record the behavior of phase transition. The SHG response of the compound was obtained on an Edinburgh FLS 920 instrument revealed that the compound was a multi-step nonlinear switching material. Single crystal data were obtained using a Rigaku Saturn 007 diffractometer at room temperature with  $\text{Mo } \pm \text{K}\alpha$  radiation ( $\lambda = 0.710703 \text{ \AA}$ ). The structure was solved by the direct method and refined using the full matrix least squares technique. Non-H atoms were anisotropic refined using all reflections of  $I > 2\sigma(I)$ . Hydrogen atoms are added geometrically and refined using the  $U_{\text{iso}} = 1.2 U_{\text{eq}}$  model, and the associated bond

lengths and angles are listed in **Table S1**.

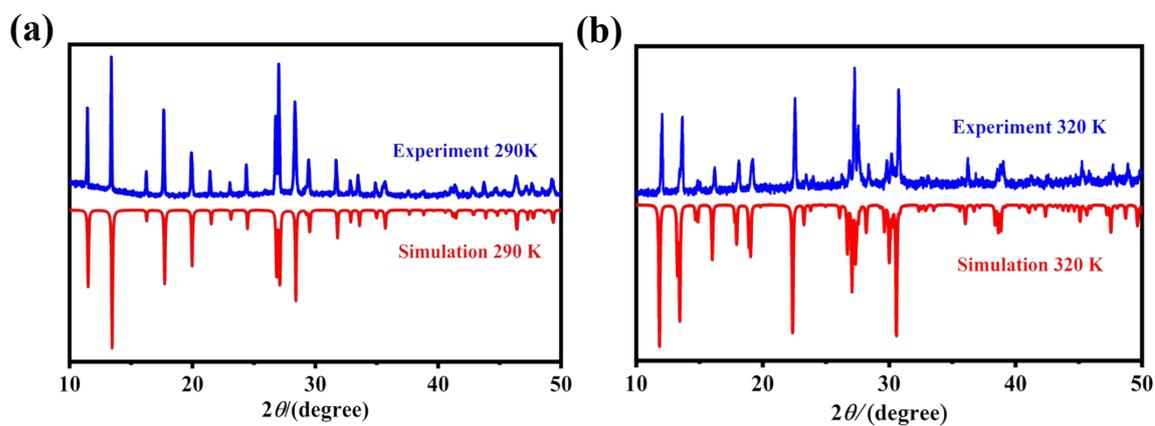

### **Material synthesis and crystal growth**

All reagents and solvents in this experiment were of reagent grade and used without further purification. (2-Fluoroethyl)trimethylammonium bromide  $[\text{Me}_3\text{NCH}_2\text{CH}_2\text{F}]\text{Br}$  and tetramethylamine iodide  $[\text{Me}_4\text{N}]\text{I}$  were synthesized by the reaction of equimolar amounts of trimethylamine (30 wt% in water) with 1-bromo-2-fluoroethane and iodoform in methanol at 90 °C for 6 h. The solvent is removed under pressure to give a mixture, which was recrystallized in n-hexane/ethanol = 1: 2 mixed solvents to give colorless solid.

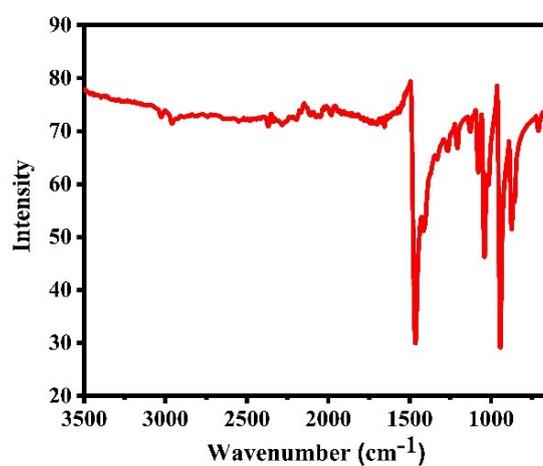

$[\text{Me}_4\text{N}]\text{FeBr}_4$  was obtained by adding excess  $\text{Ag}_2\text{CO}_3$  to the  $[\text{Me}_4\text{N}]\text{I}$  aqueous solution with stirring, resulting in the formation of AgI precipitate. After filtering, the clear solution was acidized by excess HBr solution. Subsequently, the  $\text{FeBr}_3$  solution was slowly dripped into the above solution, followed by thorough stirring to achieve homogeneity, and then the mixture was left to stand for the solvent to evaporate. Yield: 1.50 g, 74.63 %.

The crystals of  $[\text{Me}_3\text{NCH}_2\text{CH}_2\text{F}]\text{FeBr}_4$  (**1**) were grown by slow evaporation of the HBr aqueous / methanol solution containing equimolar amounts of  $[\text{Me}_3\text{NCH}_2\text{CH}_2\text{F}]\text{Br}$  and iron (III) bromide. Yield: 2.04 g, 85%.  **$^1\text{H}$  NMR** (400 MHz,  $\text{D}_2\text{O}$ )  $\delta$  5.08 - 5.12 (m, 1H), 4.97 - 5.00 (m, 1H), 3.80 - 3.91 (t,  $J = 4.0$ , 1H), 3.82 - 3.84 (t,  $J = 4.0$ , 1H), 3.30 (s, 9H) (**Figure S6**).  **$^{19}\text{F}$  NMR** (176 MHz,  $\text{D}_2\text{O}$ )  $\delta$  -218.0 - -218.5 (m, 1F) (**Figure S7**). Anal. Calcd for  $\text{C}_5\text{H}_{13}\text{NFFeBr}_4$ : C, 12.47; H, 2.72; N, 2.90%; Found: C 12.54, H 2.691, N 2.99%. IR (KBr,  $\text{cm}^{-1}$ ): 1465(vs), 1268(w), 1209(w), 1134(s), 1127(w), 1088(w),

1044(s), 946(vs), 871(m).

**Fig. S1.** The powder XRD of **1** at 290 K (a) and [Me<sub>4</sub>N]FeBr<sub>4</sub> at 320 K (b), with the simulated one in red and the measured one in blue. The measured data is matched well with the simulated data from the single crystal diffraction which means that both compounds are pure.
