## 2. Computational Details

### 2.1 Computational Details of the Evaluation of Gibbs Free Energy in Solution

In this work, the Gibbs energy was evaluated under experimental conditions (323.15 K, 1 atm and in the benzene solvent) based on the optimized geometry structures. We provided the electronic energy ( $E_{sol}$ ) with zero-point energy correction as well as the Gibbs energy ( $G_{sol}^0$ ) in solution to discuss the reaction profile. For each species, the  $E_{sol}$  is defined through eq S1:

$$E_{sol} = E_{sol}^{pot} + E_{gas}^{\nu_0} \quad (\text{S1})$$

where  $E_{sol}^{pot}$  is the electronic potential energy calculated by DLPNO-CCSD(T)/cc-pVDZ method and  $E_{gas}^{\nu_0}$  represents the zero-point vibrational energy in the gas phase. In a bimolecular process, such as the reaction of the **1NP** and HBpin, the entropy change must be taken into consideration because the entropy considerably decreases in the process. In this case, the Gibbs energy ( $G_{sol}^0$ ) must be calculated as follows:

$$\begin{aligned} G_{sol}^0 &= H^0 - T(S_r^0 + S_v^0 + S_t^0) \\ &= E^T + P\Delta V - T(S_r^0 + S_v^0 + S_t^0) \\ &= E_{sol} + E_{therm} - T(S_r^0 + S_v^0 + S_t^0) \end{aligned} \quad (\text{S2})$$

where  $\Delta V$  is 0 in solution,  $E_{therm}$  is the thermal correction by translational, vibrational, and rotational movements, and  $S_r^0$ ,  $S_v^0$  and  $S_t^0$  are rotational, vibrational, and translational entropies, respectively. In general, the Sackur-Tetrode equation is used to evaluate translational entropy  $S_t^0$ . In solution phase, however, the usual Sackur-Tetrode equation cannot be directly applied to the evaluation of  $S_t^0$ , because  $S_t^0$  is suppressed very much in solution.<sup>[S1]</sup> In this context, the translational entropy was evaluated using the method developed by Whitesides *et al.*<sup>[S2]</sup>

## 2.2 Functional Evaluation

**Table S1.** Comparison of the geometrical parameters of the **1NP** optimized by various DFT functionals with the experimental molecular crystal structure.

## 2.3 Examination of Basis Set and Theoretical Methods

In our previous work<sup>[S3]</sup>, the BS-I basis set system was employed for the hydrogen generation from ammonia borane catalyzed by the pincer-type triamide phosphorus compound **1NP**; see Table S2 for details of the BS-I. In our present work, however, the employment of BS-I for imine hydroboration reaction was hindered due to the large size of **Acr<sup>Dipp</sup>-1NP**-catalyzed reaction system. It is difficult to use the same basis set in the present work. Therefore, we made effect to reduce the number of basis sets by using BS-II. The corresponding examination of the basis set effects was shown in Table S3, where the imine hydroboration reaction by **1NP** was employed as the model system. As shown in Table S3, the energy changes evaluated by BS-II was similar to those by BS-I. It is concluded that the use of BS-II is a reasonable choice for energy evaluation. In addition, a comparison of B3PW91-D3 and DLPNO-CCSD(T) methods on the reaction energies and energy barriers for the whole reaction cycles was performed, and the calculated results are presented in Table S4.

**Table S2** Details of BS-I and BS-II.

	Phosphorus	Hydride of HBpin	methyl (Me) groups	other atoms
BS-I	6-311+G(2d)	6-311++G(d,p)	6-311G(d)	6-311+G(d)
BS-II	6-31+G(2d)	6-31++G(d,p)	6-31G(d)	6-31+G(d)

**Table S3.** Basis set effects on energy changes of the hydroboration reaction of imine.

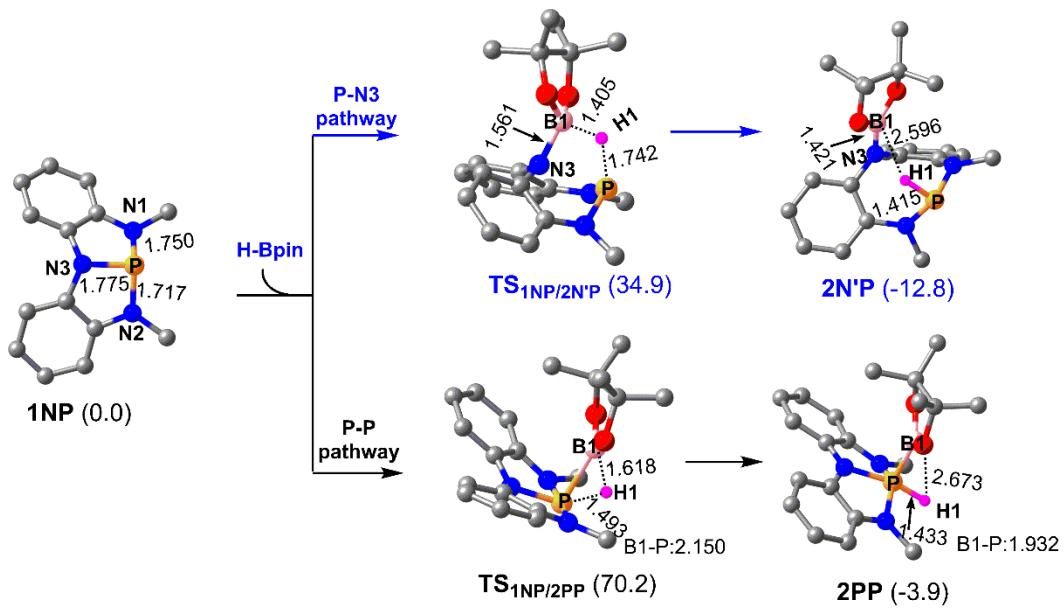

Species	$\Delta G$ (kcal/mol)	
	BS-I	BS-II
<b>1NP + HBpin + 2</b>	0.0	0.0
<b>TS<sub>1NP/2NP</sub> + 2</b>	20.2	19.5

### 3. Details of Distortion/Interaction Analysis

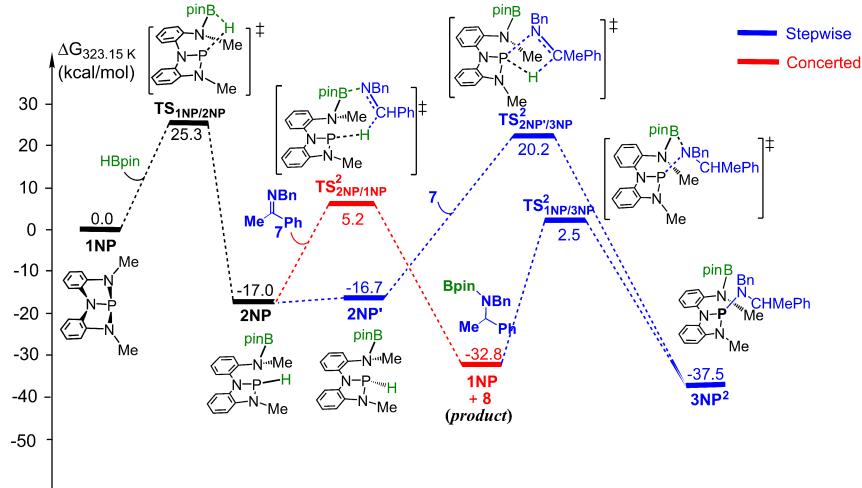

Here, we applied the distortion/interaction analysis to investigate the key transition states, **TS<sub>2NP/3NP</sub>** and **TS<sub>2NP/1NP</sub>**. Each transition state structure has been separated into two fragments, followed by single-point calculation. For each fragment, the distortion energy refers to the electronic energy change for the distortion process of **2NP**, **2NP'** and imine as they goes from the equilibrium structure to transition state, which were represented by  $\Delta E_{2NP}^{\text{dis}}$ ,  $\Delta E_{2NP'}^{\text{dis}}$ , and  $\Delta E_{\text{imine}}^{\text{dis}}$ , respectively. The interaction energy  $\Delta E_{\text{int}}$  refers to the energy releasing when these fragments form a complete transition state. The activation energy  $\Delta E$  is the sum of the total  $\Delta E_{\text{dist}}$  and  $\Delta E_{\text{int}}$ .
