<b>Nb<sub>2</sub>C</b>	-2.12 (1.92)	1.06 (0.96)
<b>Ta<sub>2</sub>C</b>	-2.36 (-2.19)	1.18 (1.09)
<b>Cr<sub>2</sub>C</b>	-1.84 (-1.66)	0.91 (0.83)
<b>Mo<sub>2</sub>C</b>	-1.61 (-1.59)	0.80 (0.79)
<b>W<sub>2</sub>C</b>	-1.57 (-1.43)	0.79 (0.72)

**Table S2.** Energy of the FM solutions relative to the NM (or closed-shell) one ( $\Delta E_{FM-NM}$  in meV) of  $p(1 \times 1)$  unit cell of  $M_2C$  ( $M=Ti, V, Cr, Zr, Nb, Mo, Hf, Ta, \text{ and } W$ ) obtained from PBE, PBE0, and HSE06 functionals at the PBE optimized spin-polarized structures, as obtained with VASP and FHI-AIMS codes, the latter marked in italics. The negative sign indicates that the FM solution is more stable than the NM one. For diamagnetic MXenes the most stable FM solution is obtained by fixing the total number of unpaired electrons as described in the text.

<sup>a</sup>The values of Ti<sub>2</sub>C from Ref. 45 of the main text have been also included to draw a clear and a wide picture of the influence of the metal atoms in these systems.

<sup>b</sup>Spin-polarized solution fixing two unpaired electrons per unit cell.

<sup>c</sup>Spin-polarized solution fixing one unpaired electron per unit cell.

**Table S3.** Energy of several FM solutions relative to the NM one ( $\Delta E_{FM-NM}$  in meV, respectively) of  $p(1\times 1)$  unit cell of paramagnetic  $\text{Cr}_2\text{C}$  and diamagnetic  $\text{M}_2\text{C}$  (M= Mo, and W) obtained from PBE, PBE0, and HSE06 functionals, at the PBE optimized spin-polarized structures for the corresponding GS, as obtained with VASP and FHI-AIMS codes, the latter marked in italics. These solutions have been estimated fixing the total net spin density per unit cell consistent with the Bader charges.
